declined to discuss the matter between the Board and the contractors, as he checked the latter's accounts and awarded the balance. The Board refused to pay the balance unless he deducted 10%, because, they alleged, he had awarded the contractors more than was fair. An action was commenced in the High Court for the recovery of the money. The defendants paid into Court 187 4s., and objected to paying the cost of clerk of works. In their affidavit they stated that if a clerk of works was required, the Board would be able to appoint one, but no request was made to the Board, and they were not aware that any had been appointed until after they received the plaintiff's account. The whole question at issue was whether Mr. Hooper was entitled to charge 6% 16s. 6d., the balance now sued for in regard to the clerk of works. The contract amounted to 250%. In filling in the usual printed form to the Education Department Mr. Hooper included 6% 10s. for clerk of works, and that was a portion of the amount borrowed from the Department. From that form the Board could have seen that the 6% 10s. would have to be paid, and no question was raised in the matter till the account was sent in. Plaintiff, in the course of his evidence, said he went to the works six times, and the clerk of the works ten times. It was a common thing to appoint a clerk of works in small jobs of this description. The first clause of the specifications contained words to the effect that the work had to be carried out to the satisfaction of himself or of his "clerk of the works." He employed his brother, a draughtsman in his office, as clerk of the works. He did not tell the Board that he intended to appoint him. If a clerk of the works had been appointed to reside at the place during the work, the cost would have been 50%.

In defence it was submitted that Mr. Hooper was employed as an architect, and in the application which the Board made to the Education Department they provided for what would probably be required. Consequently they arranged to have, if found necessary, a clerk of works, but at the same time they claimed their right as employers to make the appointment. The Board did not authorise Mr. Hooper to appoint one without bringing the matter before the Board. There was a distinct verbal stipulation that there was to be no clerk of works appointed by the architect. The Board intended to appoint a mason in their own parish to the post, but the man happened to be on the club books, and was unable to take the post.

The Judge: Then you wanted a clerk of works?

Mr. J. Crocker, F.R.I.B.A. (Exeter), said it was an invariable custom for architects to consult clients as to the employment of

a clerk of works, who was essentially an employé of the owners. Cross-examined: If an account for a clerk of works was included in the conditions, and they were read over to the owner, he should say it would be binding on the latter.

The School Board then made a counter-claim for the same amount against Mr. Hooper for damages for negligent work.

Mr. Pope said the work was incomplete and inferior in many particulars, and the Board contended that it was the duty of the architect and clerk of works to see that the work was done in this respect properly.

Evidence was called as to the claim.

The Judge said there was no doubt the Board contemplated the possibility of having to employ a clerk of works, and having saved by plaintiff employing his clerk, they ought not to object to pay the out-of-pocket expenses. He gave judgment for plaintiff, with costs in both actions; costs to be on the higher scale if Mr. Hooper could show his authority to the registrar for such application.

RECOGNITION OF MERIT.

At the meeting of the Hornsey Local Board on Saturday, 20th inst., Mr. C. F. Cory Wright, J.P., presiding, and the following gentlemen present, viz.—Messrs. H. R. Williams, J.P., H. Harper, J. H. Wilson, W. T. Pascoe, W. Piercy, C. W. Pearson, H. Burt, J. H. Borley, S. T. Homewood, J. W. Bird, C. Catling, G. Downing, and R. Caldwell-Moore, with F. D. Askey (clerk), E. J. Lovegrove (engineer and surveyor), F. A. Coleman (assistant surveyor), L. J. Tatham (solicitor), F. Matthews (assistant clerk), and Dr. H. Clothier (medical officer), a presentation was made to Mr. T. de Courcy Meade, who attended to receive the resolution passed by the Board, regretting Mr. Meade's removal from the district, and congratulating him upon his appointment at Manchester, which had been engrossed on vellum and framed.

The Chairman said he had much pleasure in presenting the resolution, which had been framed, and which was unanimously passed by the Board in July last. It was but a slight acknowledgment of the long and faithful services Mr. Meade had rendered to the ratepayers of the district, and a small mark of the esteem in which he was held by the members of the Board. He hoped it would find a place on the wall of his office at Manchester, and so remind him of the time he had spent at Hornsey. He congratulated the citizens of Manchester in

having secured a surveyor of such ability and experience as Mr. Meade. He was pleased to think that Hornsey had been the means of furnishing the second city of the Empire with an officer of such skill, ability, conscientiousness, and of such high public character. He had the confidence of all of them, and he believed he would continue to keep it. He trusted he would have many years of happiness before him.

Mr. Williams said he could not let the occasion pass without making a few remarks. He thought Mr. Meade richly deserved his work to be placed on record. No doubt he would preserve this as a memento of his work in Hornsey, and of the esteem in which he was held by the members of that Board and the people of Hornsey generally. He was now filling a most important position. A most important committee meeting had been postponed to enable Mr. Meade to leave Manchester to come there that night, and he had no doubt his assiduity, his attention, and his ability would win for him the esteem of the people of the city of Manchester. The Corporation valued his services, and he was glad that Hornsey had been the means of furnishing that city with so able an officer.

Mr. Meade said it was with the profoundest gratitude that he came there to receive the testimonial. That was the proudest moment of his life. He had given fourteen years' service to Hornsey, and all that time he had received nothing but kindness from the present members of the Board and those who had left the Board. He should take away with him the kindest feelings for the district of Hornsey and the Board. He had used his best endeavours while there, and he was glad they were satisfied.

Each member of the Board and the officers present shook hands with Mr. Meade before he left.

the requirements of the Court in its administration of the building rules of the city. The harmony and the entire absence of friction which had prevailed proved that the Court and the architectural profession were working together for the common good in their efforts to provide sound and sanitary houses and buildings for the citizens. The fact that there had been few prosecutions for default also showed that their builders and plumbers, although strictly looked after in the execution of their work, were thoroughly alive to the necessity for good material and workmanship. The work of the Court furnished an index to the state of the building trade, just as the state of the building trade was an indication of the prosperity of the city. The work of the Court during the past year showed a considerable increase in the number of warrants granted for the erection of dwelling-houses, especially tenements. This year eighty-seven warrants for tenements were granted. Last year the number was fifty-seven and the previous year forty-nine. It was satisfactory to note a continuance of the improvement in the building trade. The number of first-class houses and villas authorised was seventy-two and the number of tenement houses was 753. Of these tenement houses 224 were houses of two rooms, 284 were houses of three rooms, and the remainder were of four rooms and upwards. It should be observed that no one-roomed houses were being provided. He found also that the lowest rent of the two-roomed houses was from 8*l.* to 10*l.* It was to be regretted that no new housing was being provided for the poor and labouring classes, the reason being that the speculative builder did not, and, he believed, could not, provide new one-roomed houses having the usual convenience and water fittings to each house, even if he could get land on which to build at a very small price or small feu-duty. The one-roomed houses were provided by the subdivision of existing houses, by the landlord letting each room to a separate family, the only outlay to him being the price of another key for the entrance door. The promotion of the city improvement scheme had brought this question to the front and he hoped something practical might be accomplished during the coming year. The Court was thoroughly alive to the adoption of any improvement likely to add to the comfort and promote the health of the citizens, and he might mention that the practice of forming small, dark enclosed bedrooms or bed-closets, just large enough to hold a bed, towards the centre of the house, was likely to be condemned and, as far as practicable, abolished. As to the improvements effected in the stairs of tenements for example, these were now in every case well-lighted and spacious and therefore sanitary. The extension of the city was at present chiefly westwards and north-westwards. Comely Bank, Coltbridge, Dalry and Slateford Road districts were gradually filling up to the city boundaries, and in some cases the housing was stretching beyond these boundaries considerably. An important question should therefore be raised at this time, when the amalgamation of parish boundaries and the adjustment of the same into a city parish, with boundaries coincident with those of the city, was being spoken of—the question whether the city boundaries should not be extended to include or nearly include St. Cuthbert's parish. This was all the more important as the question of providing suburban workmen's dwellings was coming to the front.

BETTERMENT IN NEW YORK.

THE Committee of the House of Lords on Towns Improvements (Betterment) were enabled to obtain the evidence of a distinguished expert, General Egbert Viele, respecting the procedure adopted in New York in settling public improvements. The following are the principal portions:—

Chairman, Lord Halsbury.

I understand you are a civil and municipal engineer?—Yes. And you have had various experiences in the United States and New York, have you not?—Some thirty or forty years. Are you State engineer of New Jersey?—I was State engineer of New Jersey.

And you are commissioner and president of the Department of Public Parks and a member of the United States Congress?—I have held those positions.

In the course of your experience have you had considerable dealings with various public and city improvements?—Yes.

Would you be good enough to give the committee the result of your personal and professional experience in connection with some of the public improvements in the city of New York as to the opening and extending of new streets, and the methods pursued in determining and collecting the costs as to them?—Yes. In order to do it as concisely as possible I refer to the atlas of the city of New York. This is the topographical atlas; the lowest part of the atlas is taken from the surveys of the Royal Engineers previous to the revolutionary war. The upper part is the result of a regularly adopted plan under the auspices of commissioners appointed for that purpose in order to correct the evils resulting from the irregular plan of

the lower portion of the city. The proceedings pertinent to this question in the city of New York are of two characters. One is simple and satisfactory, the other is the reverse, but they are due to the two different conditions of the older portion of the city and the newer portion. The opening of streets in the newer portions of the city are generally through territory not previously occupied except by large estates. The plan devised by the commissioners was laid down and monumented, so that under the future growth of the city, which for the last 200 years has been abnormal as regards all other cities in the world, the errors of the past should be remedied. Now in opening the new streets the operation is very simple. The owners of the abutting land on the line of the streets as laid down on the map are also the owners to the middle of the street, so that when the street is taken by the city in accordance with law, so that the city shall have the title in fee, the owners are assessed for that portion of the land which is taken, but they are paid also for it; so that it is simply a question of give and take, in order to secure the title to the city. The owners receive the street in front of them for access to their land, and virtually give the land. Frequently owners deed the land in advance so as to save all proceedings. That is very simple. The lower part of the city is where the difficulty arose of attempting to adopt the principle of opening new streets where it was densely populated. The growth of the city was so rapid and the trade increased so rapidly that it was necessary to widen a great many of the streets in order to secure, first, transit to the general public; and, secondly, proper access to the buildings and warehouses. A law was passed widening a number of those streets, and one of them was under my professional observation. The street was widened 20 feet on the southern side. It was half a mile long, the houses were three or four storey houses, and had been used for residential purposes, and the commissioners appointed were called Commissioners of Damage and Assessment. Those are the terms used there corresponding to what is spoken of here as betterment and worsement.

Marquess of Salisbury.

Are not "betterment" and "worsement" American words?—They are not our words at all. We do not know them in the English language in America; they are entirely foreign words to us. "Benefit" is the word we use, which seems to me better English and more direct. To the owners of the property which is taken an award is made for damages. The proceedings there begin with an application by the law officer of the city to the Supreme Court for the appointment of three commissioners as to benefit and damage. These commissioners being appointed, they select surveyors and appraisers, and proceed in the first place to determine the aggregate amount of damages, what is to be awarded for the land taken and what is to be awarded for the buildings that are destroyed. Having determined that aggregate amount of damage, they proceed to get the money under the principle of benefit. They soon find that the property along the line of the street cannot possibly pay these damages. They therefore resort to an arbitrary line on the hypothetical principle that within that arbitrary line the property is benefited. I am free to confess that the commissioners with whom I was associated recognised from the first that it was impossible to determine that the property outside of that line was really benefited. But they were obliged to get it; there was no other resource; so they drew this line, and they found when they came to spread the damages over it that that line was not wide enough, so they widened it again, and finally they got the money corresponding to the aggregate of damages. Then their report was taken to the Supreme Court for confirmation, and the property-owners outside of that line protested that they were not benefited; but after a long contention the report was adopted. Property-owners have the opportunity of going before the Court and before the commissioners to protest against any wrong or outrage; but the results showed that as soon as that street was widened and the owners had an opportunity of rebuilding the street (in fact, it was rebuilt with a line of marble-fronted warehouses some six storeys high) the increased taxes soon paid the cost of the damages. The taxation in New York corresponds to the improvements on the property, and the improvements on this property were so great that eventually the taxes amounted to as much as had been already paid for damages. But these persons had already paid an assessment for damages; therefore they paid twice, through the increased rates and through the charge for benefit. Outside that line there has never been any real contention that there was any benefit whatever to the people, but that the benefit was to the city at large, and that these people were charged merely to get the money for the damages. That principle works with great injustice, and is utterly unsatisfactory. In some instances it has amounted to a virtual confiscation of property in the hands of those who are unable to pay the assessment, and they have given the property up and let the city take it for the award which has been made against them.

Lord Kenry.

What street are you speaking of?—Worth Street, which is at present one of the best commercial streets in the city. Worth Street, in addition to being improved for ordinary use, connected two broad avenues which previously had no transverse connection, and at the same time destroyed what is known as the Five Points, which was the St. Giles's of New York, and created a great moral benefit to the city at large; but the city at large did not pay the tax. So great has been the injustice in connection with these things that there is a class of lawyers in New York who make it a business to relieve the property owners by discovering, if possible, flaws in the proceedings, and frequently the entire proceedings are set aside, the whole matter of assessment for benefit is referred to the city at large, and put into the general taxes. There are other improvements, such as parks and so forth, that are put entirely in the general taxes. Then there was a bridge which was under my supervision, as president of the parks, known as the Madison Avenue Bridge, which crosses the Harlem River, which occupies somewhat the same position as to New York that the Thames does to London. This bridge was paid for entirely from the general taxes, and not only the bridge but the approaches. It was understood that if by any chance the approaches to this bridge enhanced the value of the property along the line, that was entirely incidental and not a matter of certainty; so that the general tax paid not only for the construction of the bridge but for the land taken for the approaches.

Chairman.

But that was an example the other way, where the whole charge was thrown upon the whole community, was it not?—Yes.

Have you any other instance of an attempt to get the tax from the adjoining owners?—In the case of Riverside Avenue, where I reside, the construction of that improvement was charged entirely to the property owners by the commissioners. On an appeal to the Courts, half of that was put into the general tax, and we were relieved from half of the assessment. There are a great many narrow streets, perhaps ten of them, under precisely the same conditions as those to which I have referred with regard to Worth Street, and frequently the same property was assessed by this arbitrary line over and over again for another street opening which it had no direct connection with, which increased the injustice.

Have you, in your experience, been able to establish any principle by which that principle of benefit, as you describe it, can be assessed on particular owners?—The principle is, to my mind, a very simple one. If the property is benefited its rates increase, and the amount of money which is paid into the general tax eventually pays for the improvement. That was the case in Worth Street. If they had simply covered it by the general tax, and the general tax paid the whole improvement, eventually that improvement to Worth Street, and the increased taxation arising from the building of those marble-fronted stores, would pay back to the city the whole of that assessment. In the case of the Central Park, where 5,000,000 dollars were paid for improvement, all that has gone back into the general tax twice over, through the increased value of the general property surrounding it, and the increased taxation on that property has paid back that money to the city.

In your judgment, is there any relation between the proximity of a house to a bridge, we will say, and the value derived to the house from the bridge?—In the case of the Madison Avenue Bridge there was no hypothesis assumed that any house or any property would actually be benefited by that in the future, because it is impossible to tell what may occur, any more than to tell where the lightning will strike.

In your experience, has the anticipation of benefit been always realised?—On the contrary, it has been the reverse. Some streets are in the same condition as they were when the commissioners opened them, and no improvement has taken place, although they have paid the value of the assessment.

How is the value ascertained there; is it by a valuer valuing?—The commissioners have an appraiser; they sit and hear the property owners, and they decide as a jury.

Upon the evidence, I suppose, of persons skilled in the value of lands who prophesy what will happen?—Precisely so.

And in your experience you say the prophecies have not been verified?—Not at all; for the reason that a great deal of this property which was assessed for benefit was in no way connected with the street, nor in any way connected with the improvement.

In your view, is there any mode by which, apart from what you have described, namely, throwing the tax upon the whole community, you can suggest that the amount of benefit obtained by each individual owner could be ascertained, and accordingly assessed?—I do not think it possible that it can be ascertained; it is a matter of the future, which is a mere conception and not a reality until it does occur.

How many instances have you known, apart from those that you have given, in which there has been confident anticipation

of benefit that has not been verified?—I will answer that question by saying that an arbitrary line was taken merely to spread over a certain area the assessment, so that it might fall as lightly as possible on the different individuals; but the exact benefit that was to be derived by those different individuals was never attempted to be ascertained.

Marquess of Salisbury.

Or even estimated?—Nor even estimated in any way upon any one piece of property. It was merely divided over an area in radiating lines and on a sliding scale. The property furthest from it was assessed the least; the property nearest to it was assessed the most.

Were the lines circles?—They were really circles, although they were broken by the lines of street. They amounted to a circumvention.

A series of concentric circles were drawn, were they?—Yes.

With different rates on each zone?—Yes.

The different rate depending on the area or upon the existing taxation of the particular tenement?—On the area of the ground; the size of the lot, as we call it.

So much a square yard?—So much a square yard; the size of the lot.

Chairman.

In your judgment, is there any ground for supposing that that accurately conveys a notion of the benefit derived by the individual properties?—It does not.

Can you suggest any mode in which it could be done?—The only mode I can conceive is that it must be put upon the general tax, and the general tax would get it from the increased value of the property along the line of improvement whenever that might take place. If it does not take place it is an injury to ask for it.

Have you any other examples which you can give the committee in support of your views?—I have given a brief statement, but I could mention quite a number of parallel cases which are of the same character.

Resulting in the same experience?—Precisely the same experience.

Marquess of Salisbury.

Is this operation in conformity with the statute passed by the Legislature, or is it by the authority of any municipal body?—In conformity with the statute passed by the Legislature.

Earl of Onslow.

By the State Legislature I presume?—Yes.

Not by Congress?—By the State Legislature. All the laws concerning the City of New York are, as a rule, passed by the Legislature. The local authorities merely pass ordinances in conformity with those laws, but the Acts of Legislature govern the municipality.

(To be concluded.)

THE QUARRIES OF JERUSALEM.*

As there are no advancements on the agenda for this evening, I take the opportunity of giving you a brief description of a visit I paid a few years ago to the quarries of Solomon at Jerusalem, and hope that the account will not be devoid of interest to the members of the only Mark Lodge (so far as I am aware) which has borrowed its name from the scene of our ancient brethren's labours. Curiously enough our Masonic ritual refers the site of the quarries out of which the materials for the building of the Holy Temple were procured to Zeredathah in the Jordan Valley, but there seem to be no grounds whatever for the assertion. It is true that we are told in Holy Writ that it was between Zeredathah and Succoth that Hiram cast the two great pillars and all the brazen vessels and utensils required for the temple service, but the obvious reasons for that are twofold. First, because the clay ground there was and still is the most suitable for making moulds for casting, and second, because at that spot both water and fuel were more abundant than at any other place nearer to Jerusalem, which circumstances were sufficient to counteract the disadvantage of its being some forty miles as the crow flies from Jerusalem, and some 3,000 feet below the level of the summit of Mount Moriah where the temple was built, with only rugged mountain paths to connect the two places. Moreover, there are no traces of quarries having ever existed in that neighbourhood. The truth is, I suspect, that the apparent absence of extensive quarries in the immediate vicinity of Jerusalem puzzled the compilers of our ritual, and led them to adopt the only name definitely mentioned in the Scriptures in connection with the labours of Hiram, and ascribe to it the site of the temple quarries. Prior to the year 1852 the puzzle remained unsolved. In that year, however, a vast subterranean quarry, the entrance to which had

* A paper by Mr. O. G. Wood, W.M., read before the "Quarries" Lodge of Mark Master Masons, No. 468 E.C.

been buried for centuries under silt and rubbish, was discovered in the north-east of the four hills on which Jerusalem stands; and this is now generally believed to be the place out of which the Jerusalem of Solomon and perhaps some of the later kings of Judah was built. My first visit to this interesting spot was made in 1887, but I had the good fortune to explore it much more carefully in 1890 under the able guidance of Brother the Rev. J. E. Hassaner, of the Jewish Mission in Jerusalem, and his brother. The entrance lies on the north side of the city, a little to the east of the beautiful Damascus Gate, and as the debris and rubbish have now been cleared away from around it, laying bare the foundations of the present north wall of Jerusalem, and some of the bare rock of Bazetha, a visit to the quarries is a very simple matter, provided you have an efficient guide with you. Armed with lighted candles, matches, a quantity of magnesium wire and a small photographic camera, our little party passed through the low doorway into what appeared at first to be a yawning abyss of black darkness, and found ourselves in a gigantic cavern supported in places by rough and fantastic pillars of the natural rock. The direction of the cavern was southerly, and with a somewhat steep decline and expanding on both sides into a series of perplexing chambers and rough corridors, in the mazes of which it would be easy to lose your way and wander helplessly until some fortunate chance should put you right, or, as the evidence of a human skeleton proves, death should close the scene. Our conductor, however, knew every inch of the place, and all we had to do was to stumble and blunder after him as best we could over the rocky and uneven ground. When our eyes got a little more accustomed to the darkness we found that we were steadily descending into the very bowels of the hill, and were soon threading our way along devious passages between large and irregularly-shaped masses of rock, which had been left by the ancient quarrymen. A closer examination of the rock showed that the stone was not of equal hardness throughout, and consequently not of equal value for building, and the devious passages in the quarry were due to the hard limestone only ("mezzeh" I think the natives call it) having been utilised, while the softer quality of stone was neglected. Under our feet were thousands of loose fragments of stone, some fair sized boulders, some the mere chippings of the masons' chisels, indicating that the stones were dressed before leaving the quarry, while around us were half-modelled blocks, apparently rejected on account of some flaw detected after their separation. At other places

blocks partially detached projected from the walls, and at one spot a huge one projected downwards as if suspended from the roof of the cavern. Here we lit our magnesium wire and found that we had reached a vast hall, in one portion of which lay two ready squared ashlars. I wonder what story is attached to those great stones, which must have cost some ancient brethren many a day of toil. They had not been "heaved over among the rubbish," and yet the approving mark of the overseer was not on them. All round the walls and roof of this great hall were the marks of the little wooden edges, by means of which the blocks were separated from the rock, and here and there were small niches for the lamps, whose feeble light was sufficient to enable our ancient brethren to prepare those wonderful specimens of their skill, some of which may yet be seen in parts of the walls of the temple enclosure. It may perhaps be well here to explain the rationale of the wooden wedges. They supplied the place of gunpowder in ancient quarrying, and by their aid the hardest granite or syenite used to be blasted. Grooves 3 or 4 inches in length and at distances apart varying according to the splitting properties of the rock were cut with the chisel and wedges of dry wood driven into them. Water was then poured over the wedges, when the expansion of the wood split the rock and separated the blocks. All through the numerous quarries in Egypt the marks of these wedges are very plainly visible; the harder the rock the closer the wedges had to be placed to one another, and in the hard granite of Assouan in Upper Egypt only a few inches separated them. In Solomon's quarries the distance between the marks was much greater. An unsuccessful attempt having been made with the aid of magnesium light to photograph this great hall, we continued our descent through more devious passages until we reached the brink of an open pit some 18 feet square, nearly filled up with rubbish, rough chippings of stones, portions of rejected ashlars and other indications of the uses to which it had been put. We scrambled down and spent a few minutes stumbling about in it; but no skilfully finished keystone or graceful corner-stone now lay there to reward our search. Clambering out of the pit, we regained the hall, and then struck off to the left up a rather steep and very stony path until we reached a sort of passage running almost due south. This passage was evidently much resorted to by our ancient brethren, and the reason was soon apparent, for on arriving at the end of the passage we found a roughly-cut basin into which a tiny stream of water trickled from a slit in the rock, and here

ROOFING FELT.

Selly Park
in Birmingham
26th Sept 94

Dear Sir,

If you ask my opinion,
I should strongly recommend
you to use 'The Potter' Roofing
Felt. You know how much
about felt as I do - at any rate
you will know how thin one
- and then one felt, and felt.
'The Potter' is called after the maker,
Andrew Potter of Wolverhampton.

Yours truly,
W. P. Nichol

Mr. Chas. Gething.

our ancient brethren must have come to slake their thirst when called off from labour to refreshment. We tasted the water, as in duty bound, but found it brackish and disagreeable. We had now exhausted the time we had to spare for this most interesting visit. As we slowly retraced our steps up the steep and rugged path, guided in part by the light of a candle which our conductor had placed upon a rocky eminence in a side branch while we were descending, the imagination busied itself in re-peopleing these dark caverns with busy quarrymen and skilful masons. We would fancy what the scene would be with thousands of little lamps occupying the niches in the walls and scattered about amongst the half-finished ashlar, casting their twinkling light on the swarthy figures of Jewish and Phœnician workmen toiling at their various labours. The ear conjured up the clink of the mallet and chisel and the hum of busy voices, sounding hollow and muffled in the gloomy caverns, mingled with the splash of the water on the wedges, followed by the dull thud of the falling masses of rock. And as at length we emerged into the bright sunlight, and the dream of anigh three thousand years old past faded suddenly at the sight of a group of sun-hatted and much be-puggared tourists nervously clinging to the saddles of their patient donkeys, I for one felt that the Mark Degree had assumed a new interest for me, and that its legend had become a living reality.

EASTBOURNE DRAINAGE.

A REPORT of Mr. Henry Law, C.E., who was consulted by the Eastbourne Corporation as to the best means of preventing the flooding of the town on the occasion of heavy rainfalls, has been sent in.

The present systems consist of high level and low level, and the high level is divided into three districts, namely, the Western, the Old Town and the Upperton. The drains from the three districts unite in one manhole, situated at the upper end of Terminus Road, opposite the railway station, their united discharging capacity being 6,258 cubic feet per minute. From this point the outfall drain, 3 feet in diameter, is carried along Terminus Road, Langney Road and Seaside to the Archery Tavern, and thence along the Wartling Road and across the Crumbles to Langney Point, where it discharges into the sea, but its inclination and discharging capacity vary greatly. The fall at the commencement is 1 in 700, and at the

end 1 in 1,572, while at one point between it is only 1 in 2,260. It receives the contents of three drains capable of discharging at the rate of 6,258 cubic feet per minute, but its discharging capacity at the outfall is only 915 cubic feet per minute, and along a portion of the route even less than that. Again, the free discharge of the outfall is stopped on the average 54 hours each tide, owing to the pressure of the sea, and when it is stated that on the outfall being tide bound and the three high level drains running full it only takes sixteen minutes to entirely fill the outfall drain throughout its whole length, the reason of flooding in a heavy rainfall is pretty evident. By the low-level system the Wish Valley and the Bourne Valley are drained. The areas lie at too low a level to be drained by gravity, and in each case the drainage is lifted by ejectors into the general gravitating systems. The chief point to note about the low-level system is that, whereas a portion of the outfall drain consists of a cast-iron pipe 4 feet 6 inches in diameter, falling 1 in 1,227, and capable of conveying 2,859 cubic feet per minute, the lower end consists of a brick drain only 3 feet in diameter, with an inclination of 1 in 1,212, and only capable of discharging 1,043 cubic feet per minute. Further, so low is the outfall that on the average it has a free discharge only eighteen tides (one-third) in the month. In addition to these systems there is the surface water drainage, by which a considerable portion of the rainfall running off the roads and roofs in the Wish Valley, Upperton and Old Town districts is carried away by independent drains.

What Mr. Law proposes is, first, to extend the system of surface-water drains in the Old Town and Upperton districts, the drains to discharge themselves into the Bourne stream or the watercourses which traverse the "Eastbourne Level." Secondly, to construct a new drain 4 feet 6 inches in diameter from the Railway Terminus to Langney Point, the upper portion passing along Terminus Road, Pevensey Road, Marine Drive, Seaside, St. Aubyn's Road and Latimer Road to the Wartling Road to be of concrete and the remaining portion of cast-iron. This drain would be watertight under pressure; it would have a uniform fall of 1 in 787.58 and a discharging capacity, when the lower end is free, of 3,570 cubic feet per minute. In addition to this new drain, Mr. Law would retain the existing high-level outfall drain as a kind of storm overflow, substituting, however, a cast-iron pipe 4 feet 6 inches in diameter for that portion between the Archery Tavern and Langney Point, which is in very bad condition. This new portion, with a free outlet, would discharge 2,646 cubic feet per

minute. The manhole at the commencement of the high-level outfall he would have reconstructed so as to allow nothing to flow into the drain until the water had risen a certain height in the manhole, and then only permitting a regulated quantity to pass. With regard to the low-level outfall, he would substitute for the 3-feet brick portion a 4-feet 6-inch cast-iron pipe, and he would put two additional ejectors, having a capacity of 1,000 gallons each, at the Archery Tavern, with another set of compressors to enable them to be properly worked. These are Mr. Law's main suggestions, and he proceeds to argue in detail how the works proposed would be effectual in the prevention of flooding under the most unfavourable circumstances. The cost of the works he estimates at 75,000*l.*, but this does not include the cost of surface-water drains, which can only be ascertained by a detailed examination of each road and building. He says, however, that the works would suffice for many years, as in making his calculations he has had regard to the future, and they had been so planned as to admit of easy extension.

ELECTRICAL MEASUREMENT.

THE electrical standards committee have issued the following final report:—

Since the date of our last report the Board of Trade have laid before us a *résumé* of the action of the International Electrical Congress held in Chicago in August 1893, to determine the units of electrical measurement. We were also informed by the Board of Trade that Her Majesty's Government had been invited by the United States Ambassador in London to take steps to adopt the recommendations of the congress. These recommendations, so far as they refer to the units of electrical resistance, electrical current and electrical pressure, are substantially the same as those suggested for adoption in our previous reports. We see no reason for further delay in the legislation of standards of the above-mentioned units, and we have prepared and attach a revised draft Order in Council, which we advise may be submitted for Her Majesty's gracious approval. The accompanying notes to the specification for the Clark's cell have been communicated by Mr. Glazebrook, and will be found of great assistance in the preparation of this form of cell.—Courtenay Boyle, Kelvin, Francis J. S. Hopwood, P. Cardew, W. H. Preece, Rayleigh, G. Carey Foster, R. T. Glazebrook, J. Hopkinson, W. E. Ayton. T. W. Blomefield, secretary. August 2, 1894.

After giving the notes and the revised draft Order in Council, referred to above, the report sets forth the new denominations of standards for electrical measurement as follows:—

I.—Standard of Electrical Resistance.

A standard of electrical resistance denominated one ohm being the resistance between the copper terminals of the instrument marked "Board of Trade Ohm Standard Verified 1894" to the passage of an unvarying electrical current when the coil of insulated wire forming part of the aforesaid instrument and connected to the aforesaid terminals is in all parts at a temperature of 15.4 degrees C.

II.—Standard of Electrical Current.

A standard of electrical current denominated one ampère being the current which is passing in and through the coils of wire forming part of the instrument marked "Board of Trade Ampère Standard Verified 1894" when on reversing the current in the fixed coils the change in the forces acting upon the suspended coil in its sighted position is exactly balanced by the force exerted by gravity in Westminster upon the iridio-platinum weight marked A and forming part of the said instrument.

III.—Standard of Electrical Pressure.

A standard of electrical pressure denominated one volt being one hundredth part of the pressure which when applied between the terminals forming part of the instrument marked "Board of Trade Volt Standard Verified 1894" causes that rotation of the suspended portion of the instrument which is exactly measured by the coincidence of the sighting wire with the image of the fiducial mark A before and after application of the pressure, and with that of the fiducial mark B during the application of the pressure, these images being produced by the suspended mirror and observed by means of the eyepiece.

In the use of the above standards the limits of accuracy attainable are as follows:—

For the ohm, within one-hundredth part of 1 per cent.

For the ampère, within one-tenth part of 1 per cent.

For the volt, within one-tenth part of 1 per cent.

The coils and instruments referred to in this schedule are deposited at the Board of Trade Standardising Laboratory, 8 Richmond Terrace, Whitehall, London.

A note is appended stating that an Order in Council in the form given in the report was made by Her Majesty on August 23, 1894.

THE EDINBURGH CATHOLIC APOSTOLIC CHURCH.

AN important piece of ecclesiastical decoration, says the *Scotsman*, has just been executed at the Catholic Apostolic Church, London Street, by Mrs. Traquair, whose painting of the cathedral song school of St. Mary's was so much admired. After Mrs. Traquair had finished that work, it was suggested to her that she might employ her talent for decoration on the Catholic Apostolic Church, the great bare wall spaces of which, left purposely to be painted when the church was built nearly twenty years ago by Dr. Rowand Anderson, have up to the present time never been dealt with. The church is Early Norman, and between the spacious nave and chancel there is a lofty arch, deeply moulded, which rises to a height of 66 feet. On each side of it and over it—the roof being 77 feet in height—is a wall area, which represents in extent a canvas equal to about 120 feet by 9 feet, and it is this space that Mrs. Traquair has successfully decorated. It was a task of no ordinary magnitude, especially for a woman—moving about as she had to do on high scaffolding, which had to be kept open to admit light from the side windows below it. In painting the spaces next the roof, Mrs. Traquair worked on a platform consisting of a couple of narrow planks, with a handrail at one side, and considerable nerve was needed to walk across the scaffolding, not to speak of being constantly upon it. But the enthusiasm Mrs. Traquair has for her art has carried her successfully through all the difficulties of this kind which menaced her, and she has finished, after fifteen months of constant endeavour, a series of mural paintings which may be regarded as quite a monumental work.

The design of the decoration is illustrative of the worship of heaven, as that is revealed in type and symbol chiefly in the Book of the Revelation. The two lower panels on each side of the arch—the one 7 feet 6 inches in depth and nearly square, the other about twice the size, though architecturally distinct—are decoratively associated together. The upper panels contain the four great cherubim (so constantly referred to in the Bible), which this religious body hold to be symbolical of the four modes of action into which St. Paul divides the orders of bishop, priest and deacon, viz. apostles, prophets, evangelists and pastors. They are represented by youth of noble mien with wings. The figures, nearly 10 feet high, admirably drawn, are arrayed in graceful draperies of different symbolical colours. Their faces are turned in the act of worship towards the altar, which has been taken as the central point of the design. Each

cherubim has below him, in the under panel, the corresponding symbol for the "Living Creature," which typifies his ministry as set forth in the visions of Ezekiel and St. John, and carries in his hand a type of his particular office. Thus, nearest the altar, on the "Gospel" side, is the apostolic cherubim, holding a golden crown, signifying rule and authority, which he is casting before the altar as an act of worship. The robes are of a golden hue, which in Scripture signifies the truth of God, and is the office of the apostle to declare. Below is the head of the lion, typifying the rule and majesty of apostleship. Next the altar, on the "Epistle" or left side, is the prophet clad in blue—the heavenly colour. He holds a golden harp, which suggests the imaginative and poetic singing of songs in the spirit. His symbol in the under panel is the eagle, typical of the prophetic ministry which soars into heavenly mysteries, and reveals them to men. Next in order is the Evangelist on the "Gospel" side, standing outside the apostle. This figure holds a Bible open at the text, "I am the resurrection and the life," and he points to the passage as if preaching from it. His colour is red, typical of the blood of the Redeemer, whose cleansing virtue the Evangelist is supposed specially to enunciate. The head of the living creature below him is the Man—to whose reasoning faculty this ministry appeals. Lastly, on the "Epistle" side, is the pastor standing outside the prophet. This figure carries in his right hand a pastoral staff, and in the left, breast high, a lamb. His colour is white or silvern, which symbolises the love of God. The living creature below him is the ox—the patient working animal of the East, a type of the domestic action of the pastorate of the Church. The living creatures of the lower panels have golden aureoles and wings, with eyes on the tips, and before them are suggestions of the mysterious "wheels" mentioned by Ezekiel. They are set against a purple background. The impressive figures of the youthful cherubim are painted against a deep blue sky, which is broken up by horizontal bands of white conventionalised clouds, and across them is thrown with admirable effect a rainbow, the arch of which has the tabernacle for centre. Above the cherubim—standing opposite the spring of the arch—is a choir of adoring angels in various coloured robes; and in higher spaces are a band of angels blowing long golden trumpets. At their feet white flowers spring. Carried from wall to wall at the height of the crown of the arch is a golden ledge, and above it are seen the four-and-twenty elders of the Revelation (4th chapter) seated on thrones and wearing golden crowns, golden stoles and purple

copies, which typify the rule and authority of their office. Over each figure is a golden canopy. The Catholic Apostolic Church holds that these elders are the two bands of Apostles—twelve to the Jews and twelve to the Gentiles—the latter, it is believed, being in office now. Highest of all, grouped in the space under the roof in a descending lunette, is a throng of figures representing the multitude which no man can number, arrayed in white robes, with palms of victory and harps and trumpets in their hands.

The work alike in design and execution is of a very satisfactory nature. The design admirably blends the symbolism of the particular church in which the work appears with the more universal attributes of the worship of heaven, and it is pervaded throughout by a fine devotional spirit recalling early Florentine work. The figures are in excellent perspective. They are gracefully drawn, and while numerous are at no point overcrowded. The cherubim panels in particular are a masterly piece of work. The colouration is rich, transparent and happily blended. It may be explained that the colours are oil, but worked in the water-colour method. The walls were prepared by a thick coating of white paint, and the high lights are got by leaving this basis exposed instead of putting white above other colours. The colours, indeed, retain their transparency because they have not been mixed. Over the colour there has been put a coating of flat varnish, rubbed up with the hand to give what is technically known as an egg-shell surface, which can be easily cleaned. The gold of the aureoles, trumpets, ledges, &c. has in some cases a relief of 6 inches, and in consequence presents a massive appearance. The ledges, trumpets, &c. in the higher spaces are bevelled on the lower side, so as the more readily to catch the light, which all comes, as has been said, from below. The Catholic Apostolic Church being open every day from ten to six, this beautiful piece of work by this gifted artist can readily be seen by all interested in it. The younger artists especially should view it. The field is one they might cultivate with advantage. Mrs. Traquair is now preparing to continue the work of decorating the church by illuminating the walls of the chapel and north transept. After these are finished she means to tackle the large oblong panels of the nave. In connection with the mural paintings on the great arch, the roof of the chancel has also been decorated in a suitable manner. The principal feature in the scheme is a representation of the "Tree of Life" designed in the shape of a heart, the symbol of Charity. On the apex are tongues of flame, in gold, on a blue

ground—the whole design suggesting the four elements of fire, air, earth and water. The colours employed are the symbolical colours already named. The designs for the roof were prepared and carried out by Mr. Andrew Hutton, Dundas Street, who also grounded the walls for and varnished the mural decorations by Mrs. Traquair.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

19056. Walter John William Wheeler and Percy Charles Wheeler, for "Improvements in apparatus for curing smoky chimneys and for ventilating purposes."

19060. Arthur Frederick Borradaile, for "Improvements in window-blind pulleys."

19068. Edward Seaman, for "A self-acting window fastener."

19080. Gustave Falconnier, for "Improvements in or relating to the construction of transparent or translucent walls, ceilings, floors or the like."

19088. Thomas Bradshaw Jack, for "An improved syphon cistern."

19119. James Hall Foote, for "Improvements in pulley casing for window frames."

19120. Charles Hall, for "Improvements in clamps for pipes."

19180. Charles Alexander Balph and Elisha Pierson Swift Wright, for "Improvements in or relating to fireproof floors and ceilings."

19182. Henry Isidore Dakin, for "Improvements in water-closets and in pipe connections therefor and for other purposes."

19331. Anthony Roy Austin, for "Improved means for opening window sashes inwardly."

WINTER, WARMTH & COMFORT.

HEATING AND VENTILATING APPARATUS.

GRUNDY'S SPECIALTY. PURE WARM AIR.

UPWARDS OF ONE THOUSAND TESTIMONIALS RECEIVED.

PURE WARM AIR, as Supplied to

Truro Cathedral; Londonderry Cathedral; Sherborne Abbey; Kilmore Cathedral; Stanley Cathedral, Falkland Islands; Cardiff Catholic Cathedral; the Queen's School Chapel, Eton; Cork Asylum; Leicester Asylum; and to upwards of three thousand Places of Worship; and a great number of Mansions, Houses, Hotels, Hospitals, Schools, Warehouses, Factories, Workhouses, &c.

84 Brook Street, Grosvenor Square, W.: December 8, 1893.

Sir WILLIAM BROADBENT encloses cheque for the "GRUNDY" HEATING APPARATUS supplied to his house, and is glad to say that it has proved very satisfactory for warming and ventilating as required. The principle of the apparatus is most excellent.—To Mr. Grundy.

PROFESSOR TYNDALL writes:—

October 24, 1893: Hind Head House, Haslemere.

Dear Sir,—My house being so well provided with grates and flues for the generation and distribution of pure warm air, I have been thus enabled to spend my winters in England instead of on a foreign shore,—Yours very truly,

JOHN TYNDALL.

Dr. GRIEVES says:—

I have insisted upon my architect adopting the "GRUNDY" system of pure warm air for Heating and Ventilating Buckhurst Manor. I should not like my house warmed with any other method, for I like plenty of ventilation and do not approve of stagnant air.

Buckhurst Manor, Wadhurst.

AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TRADE NOTES.

THE Japanese boat s.s. *Islam*, belonging to the Japanese Government, which was recently detained on the Clyde by the orders of the British Government, has now arrived at Yokohama, and Messrs. Baird, Thompson & Co., Limited, have received a high testimonial concerning their improved mechanical system of ventilation introduced by them. This company at present are very full of orders, and lately have secured several very important contracts. Amongst other contracts just completed by them we may mention St. Bartholomew's Hospital, Royal Hotel Buildings, Grand Hotel Buildings, Burton-on-Trent Municipal Buildings, Lye Schools, &c. We may mention for the benefit of our readers that this company have at present in the press a new catalogue containing numerous improved designs of ventilators and other specialties. The work when finished will be a great improvement on previous catalogues, and we understand an important reduction in their prices have been made. An early application should be made for a copy.

At the meeting of the Preston Town Council it was agreed to accept the tender of the Stanton Iron Company, of Nottingham, of 21,394*l.* for the supply and delivery of water-pipes for the new storage reservoir which is being made at Alston, near Longridge.

THE Woodhouse Schools and the Normanton Common Schools for the Normanton School Board are being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

At the meeting of the Walsall Board of Guardians the tender of Mr. A. Lynex for the erection of the Workhouse Infirmary buildings for the sum of 6,526*l.* was accepted. There were nineteen tenders, ranging from 9,280*l.* down to 6,371*l.*

It is announced that Mr. S. P. Colman, the much esteemed local manager of the London and Lancashire Fire Insurance Company at the Birmingham branch, is, after thirty-one years of service, about to retire upon a liberal pension. Mr. Colman will be succeeded by Mr. Robert Rutherford Brydone, who, following upon a general varied experience of home fire business, has for the past three years occupied the position of manager of the London and Lancashire's business in South Africa.

A STAINED-GLASS window has been placed in the transept of the parish church at Dowlais, in memory of the late Mr.

J. R. Jones. The window has three lights, the centre subject being "The Resurrection;" in the left-hand light our Lord is depicted as "The Light of the World," and on the right hand as "The Good Shepherd." The work has been designed and executed by Messrs. Jones & Willis, of Great Russell Street, London, W.C.

THE Guildford Rural Sanitary Authority have adopted a scheme of sewerage and sewage disposal for Woking. Mr. Radford, of Nottingham, is the engineer.

A MEETING of the markets and fairs committee of the Birmingham City Council was held to consider the tenders sent in for the erection of the new meat market and slaughter-houses in Bradford Street. A week ago the tenders were opened, when it was found that the lowest estimate was that of Mr. John Bowen, which exceeded the sum of 45,000*l.* the Council authorised as the maximum for the erection of the buildings. The committee made certain modifications in their scheme which would have the effect of reducing the tenders. The committee decided to ask the Council at the December meeting for power to spend more than the 45,000*l.* on the buildings.

ACCORDING to the *Birmingham Post*, Messrs. Wood & Ivery, Limited, West Bromwich, have secured the order in connection with No. 2 contract of the Birmingham Water Scheme. This firm, who are reputed to be the largest manufacturers of blue bricks in Staffordshire, have booked an order from Messrs. Morrison & Mason, Limited, Glasgow, the contractors to whom the work has been entrusted, for over 4,000,000 of best pressed blue bricks, and 1,150,000 invert blocks and copings.

It is further stated in regard to the new railway to London that Messrs. Wood & Ivery, the Albion Blue Brick Works, of West Bromwich, have received large orders for millions of bricks to be used in the construction of the railway. The contracts for the undertaking are let out in seven sections, and the orders have been secured by the firm mentioned for bricks required in three or four of these sections.

At the meeting of the Lord Provost's committee of Edinburgh Town Council it was agreed to recommend to the Council that the offer of Sir William Arrol & Co. should be accepted for the erection of the new North Bridge. The estimate is said to amount to about 81,000*l.* It is understood that the sub-contract for mason-work has been given to Messrs. William Beattie & Sons, builders, Edinburgh.

1a CRESCENT, MINORIES, LONDON, E.C.

At St. James's Church, Wednesbury, Mrs. Chas. Prescott, of London, formally started a large clock, of which she is the donor. It has three dials, chimes the Cambridge quarters and strikes the hours. The whole of the work has been carried out by Messrs. John Smith & Sons, Midland Clockworks, Derby.

THE *Birmingham Post* says:—In reply to inquiries made at the Horseley Company's works, Tipton, our Dudley correspondent was informed by one of the principal officials of the firm that the statement which has recently been current in the neighbourhood that they had received an order for 35,000 tons of bridge-work, in connection with the extension of the Manchester, Sheffield and Lincolnshire Railway from Annesley to London, was incorrect, the contract placed with them, it was stated, not being one-fourth of this amount. A considerable amount of reserve was manifested in reference to the matter, the company's officials, declining to state the actual weight of the work to be executed by the company or its approximate value. It was ascertained, however, that the bridge-work in connection with the new railway has been divided among seven leading British manufacturers and that, although the order secured by the Horseley Company was an extensive one, it was not the largest. About 600 hands are at present employed by the company and, as the completion of the contract will extend over a period of two years, it is not anticipated that its execution will necessitate the employment of any additional labour.

We have much pleasure in announcing that Mr. John Grundy has been awarded the highest award at the Manchester exhibition for his patent smoke-consuming grates.

BUILDING AND BUILDERS.

THE laying-out of the Sparkhill Estate, near Birmingham, which has been in progress for some considerable time, is approaching completion. The local architect, Mr. J. Statham Davis, has already prepared plans, &c., for a large number of commodious villa residences thereon, and the total expenditure will probably exceed 100,000/. The contractors are Messrs. Hughes & Son, of Sparkhill.

A POLICE station is to be erected at Upper Wortley, Leeds, with accommodation for fire-brigade purposes.

At the meeting of the Edinburgh Dean of Guild Court a warrant was granted to the School Board for the erection of a

school at Broughton Road. The site of the new school is that formerly occupied by Blandfield House. Mr. R. Wilson, the architect, has taken advantage of a slope in the ground to form a basement floor at the back, in which there will be placed a swimming-bath and gymnasium. On the ground or street floor is to be the infant department, and on the upper floor that for juveniles, as well as rooms for the study of science and practical cookery. In the playground, occupying the front and sides of the school, a workshop will be located, while at the entrance gate is to be erected a janitor's house. Accommodation for 512 infants and 854 juveniles will be provided in the respective departments. The whole structure, which, with furnishings, is expected to cost between 23,000/ and 24,000/., is to be heated and ventilated in the most modern style. Renaissance, adapted to school purposes, is the style of architecture chosen by the architect. The contractor is Mr. William Gerard, Edinburgh.

THE *Leeds Mercury* says:—Messrs. B. Whitaker & Sons, of Horsforth, with the view of meeting the demand for good houses with country surroundings, and within easy access of Leeds, Bradford and other populous centres, are laying out their Hawksworth Wood Estate, of 200 or 300 acres, for the erection of some 300 modern detached and semi-detached villa residences, with a useful piece of ground to each. They intend to deposit the plans for approval at the Town Hall in a day or two.

VARIETIES.

AT a crowded meeting held at 40 Holborn Viaduct Mr. F. St. John Parker, president of the Society of Diplomatized Teachers, presented to the successful candidates sent up by the Yost school the prizes and certificates granted by the Society, including the Society's bronze medal to the competitor who took highest place in the examination in typewriting open to the whole country.

THE death which is announced of Mr. Thomas Warden, churchwarden of Holy Trinity Church, Stratford-on-Avon, is believed to be owing to the criticism and ridicule he incurred by reason of selling the doors of Shakespeare's church for firewood.

AT the meeting of the Bury Town Council the mayor, Mr. J. Ashworth, presented to the Corporation some seventy or eighty etchings and engravings, which were to be used, he stated, as "a sort of itinerant collection," to go round among

the elementary schools of the district, the purpose being to assist in educating the eye and training the taste of the children.

THE *British Medical Journal* says:—The report of the law and parliamentary committee of the West Riding County Council states that in reply to communications from the committee, the Local Government Board had stated that they could not undertake to make special inquiry, with experiments, as to the action upon lead of water in the cases of all new schemes of water supply, as had been suggested by the committee, although they considered that it was a matter which should be carefully considered in connection with new water supplies. The committee, being of opinion, after conference with the sanitary committee, that the evil would be remedied by the substitution of iron pipes for lead, had directed the West Riding solicitor to communicate with the Local Government Board, requesting that steps might be taken to confer power on the County Council to prohibit the use of lead pipes in connection with any public supply of water which, when in contact with lead, might cause lead poisoning.

THE Secretary of State for Foreign Affairs has received from our Consul at Corunna a despatch announcing that the Spanish Minister of Public Works invites tenders for the construction of a dock at San Estevan de Pravia, in Asturias. The cost is estimated at 70,000*l.* Plans, &c., may be seen at the Ministry in Madrid, and at the Department of Public Works in Orviedo. Tenders will be received up to November 30.

THE *Irish Times* says:—We understand that Mr. Buckley, T.C., has been elected chairman of the electric-lighting committee of the Corporation of Dublin, in room of the late J. L. Robinson. No better selection could have been made for a particularly responsible office. The difficulty of filling the place is all the greater in following one who was so active and specially qualified for the position as the chairman whose decease has been so much lamented.

THE Birmingham coroner, at an inquest about the death of a painter who was killed by a fall from a scaffold on which he stood while painting one of the markets, said more security was needed not only for the workmen, but also for the public who passed beneath the scaffold. Something in the nature of a strong tarpaulin net, in the place of the linen one used for the debris, would no doubt meet what was desired. The foreman of the jury added that, while they were of opinion no blame

attached to anybody, they strongly recommended the Association of Master Painters and Decorators to ask the trade to provide some such netting as would prevent similar accidents. Mr. Breakspear, the contractor, expressed his regret at the accident, and said that, as no provision was made in the estimate of the contract with the Corporation for such a netting as was suggested, perhaps the Corporation would contribute something towards its cost.

THE MANCHESTER SHIP CANAL.

AT the present time Warrington may, the *Liverpool Courier* says, be said to be impaled on the horns of a dilemma. This is so in regard to its relations with the Manchester Ship Canal Company. It is a dilemma which constitutes the one absorbing theme of speculation and discussion in municipal and trading circles. But beyond and above this, it is a dilemma of an exceedingly dangerous and unpleasant character so far as the public health of the borough is concerned.

In 1885 an Act was adopted by the Manchester Ship Canal Company and sanctioned by Parliament, and in this Act were certain sections for the protection of the Warrington Corporation, and of traders, manufacturers and others carrying on business at or near Warrington. One of these sections stipulates that the company should provide for a minimum flood of water down the river sufficient for the sanitary purposes of the borough and for the supply of the manufacturers. The precise stipulations are that of 100,000,000 cubic feet of water passing from the direction of Manchester over the weir at Warrington, the Canal Company should be allowed to divert a maximum quantity of 10,000,000 feet, and so on in ratio. Since the canal has been opened, however, the flow of water has scarcely been a tithe of the stipulated quantity. The result has been that for months past that portion of the river which flows through the town and beneath Warrington Bridge has assumed the character of nothing less than an immense cesspool—an almost stagnant body of sewage and other pestilent filth. Much of this is the deposit from the sewers of the town, which under ordinary circumstances would have been swept down to the sea, but the bulk of it is filth and sewage which has dribbled down the stream from Manchester. The tidal flow between Widnes and Warrington has also decreased to an alarming extent. Tides which aforesaid enabled barges and steamboats to navigate

Extract from THE GENTLEWOMAN (MR. PANTON).—"You can find all the furniture at Hewetsons, or if you are dubious of your own powers, you could either send me the price catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

Replica of an OLD ENGLISH Carved Oak Hall Press, 16th century, 5 feet wide, 7 feet 6 inches high.

to Warrington are no longer useful in this direction. They have lost all strength of "scour," the river bed is quickly silting up and the tides only serve to stir up the noxious deposit on the bed and the banks and accentuate a stench which permeates the air for a great distance about the river. This, in itself, is exceedingly serious. The areas contiguous to the river banks—on the Cheshire side especially—are densely populated. The poisonous effluvia which arises from the deposit has to be battled with in the hundreds of adjacent houses, disinfectants have almost hourly to be used, sickness is prevalent to an alarming degree, and the medical profession are unanimous in their condemnation of the nuisance. The other Sunday the dangerous and objectionable smell became so powerful that the worshippers in the parish church, which stands at a considerable distance from the river, experienced much discomfort.

Week after week have deputations from the Corporation met the Ship Canal people, and although at length the company have consented to carry out certain works up the river near Warburton and Butchersfield, for the purpose of creating a stronger flow of water, many experts believe that the nuisance even then will not be remedied. In the meantime the public health of Warrington is being not only endangered but detrimentally affected, and the value of the house property near the banks of the river is falling to an alarming extent.

The Mersey at Warrington has not, since its pollution was first commenced, been a "thing of beauty" and never gave promise of being "a joy for ever." But though the fall of sewage into the stream which has been going on for years encaked its bed with black, repulsive slough, the public were very seldom annoyed by a sight of it, and the hourly dangers created by the present condition of things were unknown, for the tides were always strong enough to carry the deposit to the sea before it became fetid. It is generally considered by experts that the works being carried out by the Ship Canal Company will not be effectual in abolishing the nuisance. And what steps should be taken if this be the case no one seems to know, and indeed nothing can be done unless Parliament steps in and peremptorily puts a stop to the pollution of the river at Manchester. A more obnoxious or unhealthy sight than the black, evil-smelling water and abutting deposit of filth could not be imagined. Nor, indeed, could a more efficacious means of germinating disease be devised than the present condition of the Mersey at Warrington.

But the borough's grievance does not end here. There is

another section of the Act in question of infinite importance to the commercial well-being of the town. According to this section the Canal Company are bound, in order to safeguard the rights of the riparian owners from the silting up of the stream, to make "and for ever maintain" a dredged channel from bank to bank, having a minimum depth of 8 feet at low tide, in a part of the river from Latchford Weir to the works of Monks, Hall & Co., some two miles down stream. The dredging of the channel has no doubt been attempted, but the stipulated depth cannot be maintained, and the result is that navigation has practically come to a standstill. Although the company have had dredgers at work since January 1, the labour and expense seem to have been in vain. Almost as quickly as the channel is deepened it silts up again. Experts have come to the conclusion that it is a physical impossibility to keep the channel in the bed of the river 8 feet deep without an enormous permanent expenditure involved in the dredging. It is a fact well agreed upon that the dredgers will always have to be at work to prevent the river even becoming almost totally unnavigable. The company, however, are, according to the Act, compelled to carry on the work, or for every day after July last when the channel is not maintained at its stipulated depth pay a forfeit of 50s. per day. In consideration of some work which the company carried out at the request of the Corporation—namely, the construction of a lock from the canal into the river—the period was extended from July 1 to October 1. Since that date, however, there have been dredgers at work day by day, and still the depth of the channel cannot be maintained.

The work has already cost many thousands of pounds. The accruing of the daily forfeit, if it be not quickly avoided, cannot fail to land the company into one of their most serious financial difficulties. They have recognised this, and are endeavouring to arrive at an agreement with the Corporation of the town to avoid the embarrassments of the situation. Deputations are constantly meeting, and negotiations are known to be on foot for the purpose of releasing the Manchester Ship Canal Company in some way from the statutory obligations above referred to. It is urged on their behalf that, either from want of funds or because of the physical condition of the river, it is impossible for them to comply with the Acts of Parliament. The feeling of the members of the Corporation on the point is extremely strong, but they recognise that it would be almost impossible to enforce the legal penalties, and hence they are

Trade Mark (Regd.)

anxious to arrive at some suitable compromise. What this is likely to be no one but themselves and the Canal Company's deputations know. The whole of their transactions are carried on privately, and the press are, in consequence of resolutions enforced by the company's deputations, kept severely in the dark. The traders, however, are beginning to tire of the whole business. There is a powerful feeling among them that some concerted action should be taken. The more practical of them, who use the river to a considerable extent, can only see one fair method of compromise. They see that the river cannot for ever be dredged by the company, the expense would be too great; therefore they demand that they should be allowed permanently a free waterway along the Ship Canal from Eastham to Warrington, and this demand in all probability will be conceded.

The construction of the docks appears now to be a dead letter. It was the hope of having these made that induced the Warrington public to enter into the movement for the construction of the canal with so much enthusiasm. When the Bill was passed by Parliament there were torchlight processions and a generally wild display of gladness. The traders and others thought that the "tide" which was to lead them to fortune was the one that would bring ships to their docks. The vision has been dispelled. They feel themselves, to use the vernacular, to have been "left." It is like to the imbibing of the essence of wormwood to many of them to recognise the unmistakable truth that the town has been sacrificed for the benefit of Manchester. Poor Warrington! To be belated in most things seems ever to have been her fate; but how much is the truth evident in this instance?

THE CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

THIS Society have recently visited the works of Messrs Maudslay, Sons & Field, Limited, of Lambeth, over which they were taken by Mr. G. M. Lemmi on behalf of the firm. The party were first shown the historical portion of the works, which is the birthplace of modern machine tools, the first self-acting lathe having been invented and constructed by Maudslay. Lathes constructed as long ago as 1800 are still at work, as also are three table engines constructed as long back as 1824. The members were then shown the engines in course of construction for H.M.S. *Renown*, together with a number of engines for torpedo-boat catcher vessels. A pneumatic

dynamite gun was then inspected. Various propellers in phosphor bronze, cast and wrought steel were shown. The visitors were then taken to the "Belleville boiler" and were shown the simplicity of its arrangement, the ease and facility with which it is worked, the readiness with which steam can be raised and the many other good qualities of this boiler. This type of boiler is not an experimental one, as it is now becoming largely used by both mercantile and naval vessels. The two warships *Terrible* and *Powerful* are to have boilers of this type; the French have adopted them, the Spaniards have adopted them, and they are in use in some of the largest mail steamships. Another type of water tube boiler, the "White," is also constructed at these works, it having proved very efficient; it is used principally for the smaller class of vessels, such as torpedo-boats. The party then visited the smithy and foundry, the latter being famed for the excellence of its productions. The model room, an important feature of this establishment was not passed over, for the superb models it contains of various types of marine engines are a pleasure to all who have the opportunity of seeing them. At the conclusion of the visit a hearty vote of thanks was given to the firm and Mr. Lemmi, to the first for the opportunity afforded for inspecting these works, and to the latter for his great attention and courtesy.

A NEW FIREPROOF SYSTEM.

A NUMBER of architects, engineers and others on Friday last inspected a system of fireproofing, the invention of Mr. T. L. Banks, at the works of the St. Pancras Iron Co. A brick building had been erected, its lower storey being filled with inflammable material, which was set fire to and allowed to burn for thirty-five minutes. The strength of the flames was very great. The fire was finally extinguished, and the party then examined its effects. The room had been ceilinged on the new system, and it was found that beyond slightly cracking the plaster no harm had been done. Nor had the heat penetrated the room above, where a block of ice remained unmelted. The fireproofing consists of helical metal lathing covered with plaster, and so fixed that a small chamber, through which passes a current of air, is left between the floor above and the ceiling below. It is impossible for the heat to reach the joist ends, so that no twisting of these from the heat of the flames results. We shall probably in a future number give an illustrated description of the invention.

THE LONDON COUNTY COUNCIL AS CONTRACTORS.

At the meeting of the London County Council on Tuesday the works committee presented accounts showing the differences between the estimated and the actual cost of works entrusted to them. The total estimates amounted to 66,061*l.* 1*9s.* 2*d.*, while the actual cost was 63,045*l.* 18*s.* 5*d.* They claimed that in such works as excavation, brickwork, &c., the cost compared very favourably with that of contractors, but in architectural work, where the cost had exceeded the estimate, their work was of such a quality as is only comparable with that executed by builders of the highest class, who very seldom undertake work at competitive prices. They consider they have had to work under difficulties, such as unsuitable premises, second-hand machinery worked by old and wasteful engines, and so on, and these conditions will have to continue until nine or twelve months hence, when the new workshops, stables and offices will be completed.

Mr. Westacott moved that the report be received with the exception of the paragraph referring to the cost of the works of the Council. In the report before the Council there were thirteen items mentioned of which nine cost more than the estimate and four less. The only work they could manage to

do under the estimate was that done under ground, where it could not be seen. Nearly every matter referred to the committee cost more than the original estimate, and they were by no means saving the ratepayers' money.

Mr. Hoare said that the committee had not been in existence a sufficient length of time for the Council to ascertain the profit or loss arising from their operations. He suggested that the Council might later on obtain powers to compete with contractors for the work of local authorities.

Colonel Rotton urged the committee to make a clean breast of the matter and tell the Council if they had lost money and how they had lost it.

Lord Farrer agreed with Mr. Hoare that it was too early yet to say whether the works committee was a success or not. He hoped they would take into consideration the suggestion that they should offer to do work, especially sewer work, of which they had large experience, for vestries and other boards in London in competition with contractors.

BOARD OF TRADE AND LIGHT RAILWAYS.

THE following letter has been addressed to the following public bodies:—Associated Chambers of Commerce, Central and Associated Chambers of Agriculture, London Chamber of Commerce, Railway Companies Association, Institute of Civil Engineers, London County Council, Association of Municipal Corporations, Association of County Councils:—

Board of Trade (Railway Department), 7 Whitehall Gardens, London, S.W.: October 29, 1894.

Sir,—I am directed by the Board of Trade to communicate with you on the subject of a movement recently set on foot with the object of obtaining further powers and facilities for the construction of light railways and steam or electric tramroads. It has been alleged in some quarters that the requirements which are imposed by the Board of Trade upon new railways in the interest of the safety of the travelling public and of the railway servants, as well as for the public convenience, may stand in the way of those who are desirous of promoting railways through agricultural or sparsely-populated districts.

It has also been urged that light railways may have great utility and importance as a means of assisting those who suffer from the depression in agriculture, by affording them

easy and inexpensive means of bringing their produce to the best markets.

The same observation has been made as regards an even more difficult branch of the subject, namely, the possibility of relieving populous urban districts by giving special opportunities to workpeople to travel in and out of towns at a minimum cost, or by making it easier for manufactories to be established in suburban or country districts.

Interest in the movement has no doubt been stimulated by the action of those foreign countries in which light railways have been developed.

The Board of Trade are sensible of the importance of the question in these various aspects, and have taken great interest in the representations which have from time to time been made to the Department, but they have not yet had before them practical proposals which would enable them to decide how far a demand for economy in construction would justify relaxation of any of their usual requirements now enforced in the interest of safe working, and whether a change in the law by which necessary powers might be more easily or cheaply obtained would be likely to be followed by any considerable development of the modes of transport contemplated.

It may no doubt be contended that the powers conferred by the Railways Construction Facilities Act, 1864, as amended by the Railways (Powers and Construction) Acts, 1864, Amendment Act, 1870, and the Regulation of Railways Act, 1868 (Part V.), on the one hand, and the Tramways Act, 1870, on the other, are sufficient to satisfy the requirements of ordinary trading companies desirous of constructing and working light railways or tramroads. The Board of Trade are, however, so much impressed by the desirability of obtaining all the information which can be afforded by persons interested in the movement that they think it well to take prompt steps for the purpose of eliciting and focussing such views and information. And they conceive that both local authorities and traders, as well as the existing railway companies, will welcome an opportunity of joining in a discussion inaugurated with this object.

I am therefore directed by the Board of Trade to inquire whether the ——— would be disposed to depute ——— members of their body to attend such a conference at the Board of Trade on an early day with the object of discussing:—

1. How far the usual requirements of the Board of Trade as to constructing and working new railways may fairly be relaxed, especially in the case of lines built through sparsely populated and agricultural districts.

2. Whether additional legal facilities for obtaining powers to construct tramroads and light railways are necessary or desirable.—I am, Sir, your obedient servant,

COURTENAY BOYLE.

THE NEW CRAIG HOUSE ASYLUM, EDINBURGH.

THE opening ceremony of New Craig House, in connection with the Royal Edinburgh Asylum for the Insane, has taken place. The splendid building, which has been in progress for about five years, is, says the *Scotsman*, an admirable architectural adornment to the elevated site it occupies in the south-west side suburbs of the city; while internally its arrangements and fittings have been brought up to date, so as to make it in all respects a first-class house for the unfortunate class of patients for whom it is intended.

The plans are by Messrs. Sydney Mitchell & Wilson, who have been alike most successful in their conception and execution of this important building. The style is the later phase of the French Renaissance, which has enabled the architects to introduce what was desiderated by the medical superintendent of the asylum, Dr. Clouston, great variety and attractiveness into its composition. Viewed from the north, the central feature is a massive square tower 100 feet in height, about which the other parts of the design group themselves in a picturesque and effective manner. Variety of line and feature is secured by the introduction of towers with bell-shaped roofs at the angles of the buildings, and on the face of the north and south projections and wings; by a line of circular-headed dormer windows on the third floor, by ornamental gables, carved and broken pediments, open balustrades, bold chimney stalks and high-pitched roofs, and by blending in its construction red and white stone. On the building there is little or no detailed ornamentation. The aim of the architects has been to produce a composition which at a distance will have an imposing effect, and close at hand agreeable general lines and features. In this they have admirably succeeded. Seen from Myreside, the asylum rising on the crest of the hill over a screen of trees—at this time of the year robed in autumn colours—presents a most picturesque aspect.

The asylum building extends east and west for a distance of 360 feet and from north to south, measuring the central block, 250 feet. The ground plan shows a building shaped like a capital "E," with the middle stroke carried further backwards than forwards, thus, "—E." The open face is towards

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

ARGAND

" 44 " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.

WELSBACH

" 10 " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

THE INCANDESCENT GAS LIGHT CO., LIM.,
14 Palmer Street, Westminster, London.

the south, while the back stroke runs out towards the north. In this centre block are the great hall and all the important public rooms. The chief entrance is placed in the north-east angle and is approached by a spacious gravelled court. The entrance porch opens upon a large oak-lined vestibule, on the east side of which are waiting-rooms for visitors and a doorway leading to rooms above set apart for the use of the medical superintendent and his assistants. Passing inwards and ascending a broad flight of marble stairs, the visitor arrives in the great hall, which will form a rallying point in the common life of the institution. It is large and lofty—63 feet long, 33 feet 6 inches wide and 45 feet high to the crown of its vaulted ceiling—and most attractively, even richly, decorated. It is panelled in oak to a height of 12 feet. Higher the walls are divided by ornamental pilasters into six vaulted bays. Above these is a deep frieze with flower garlands and cherubs in high relief, while below the under line of the frieze are scrolls on which are emblazoned the names of the cardinal virtues. The ceiling is coved and panelled and richly decorated in gold and other colours. The colour scheme is based on the three primary colours, blue, red and yellow, and the solid gilding everywhere visible gives the hall a bright and handsome appearance. The lighting is by means of a small clerestory and a large finely-proportioned Venetian three-light window facing north, 30 feet high and 25 feet in breadth. At the south end is open screen-work in oak, communicating with what is in reality a corridor leading to the officers' quarters, but which from the hall looks like a musicians' balcony. On each side of the hall is a handsome brown stone chimney-piece with hood. The upper spaces are panelled in alabaster and carry medallions of Dr. Andrew Duncan, the original founder of the institution, and of Dr. Clouston, the present medical superintendent. Below are panels in which are sculptured the arms of these gentlemen, as also the armorial bearings of the city of Edinburgh, the University and the Royal Colleges of Surgeons and Physicians. Artificially the hall as well as all the rest of the building is lighted with electric light. The electroliers suspended from the ceiling are of wrought-iron, artistically designed and gilded, and there are also side brackets. This central hall will play an important part in the social life of the institution, as it will be used for morning prayers, for church on wet Sundays, for dances, theatricals, concerts and other entertainments. Opening off this hall on the south side are two large rooms—a drawing-room facing east and south and a billiard-room. The former is 40 feet long by 22 feet wide and 15 feet high, with a

rectangular bay 4 feet 6 inches deep. The latter room is 30 by 22 feet, with a large recessed fireplace or ingle-nook 17 feet wide and 5 deep, raised one step from the floor. The drawing-room has been charmingly decorated. The walls are panelled and hung with old rose French silk tapestry. There is a pretty stencilled frieze. The paint for the most part is cream and gold, and the ceiling is panelled in soft French blue. There are two fireplaces with overmantel mirrors, as also a nice cosy nook with fireplace in a corner circular turret. The room has altogether an air of elegance and refinement which would not be out of place in a nobleman's mansion. The fact is that nothing could better illustrate the modern method of treating the insane, as compared with the Mediæval dark hole and chain system, than the manner in which the new asylum has been planned and decorated. If a visitor were set down in the midst of it without having been told what the object of the building was, he would very probably hazard the opinion that he was in a splendid country mansion. It is one of Dr. Clouston's leading principles that in the treatment of the insane their surroundings should be made as bright and pleasant as possible. Everything, he has said, which produces cheerfulness of effect inside and outside of the asylum should be studied, and to that end variety has been given to the shape, size and aspect of every room in the building, if not structurally at least decoratively, so as, if possible, to interest, rouse and cheer the patients in their passage from one to the other. The dining-rooms, five in number, and situated on the north side of the great hall, vary in size from 28 feet by 20 feet to 32 feet by 35 feet, and are distinctively and beautifully decorated in full tones, and not two of the bedrooms are papered and painted alike. The corridors partake of the same variety of treatment, yet all are in excellent taste. Below the dining-halls is a spacious suite of kitchens, sculleries and other offices, all lined with white tiles. Communication with the floor above will be maintained by means of lifts and service stairs, while connected with each dining-room on its own level is a service-room fitted up with hot plates, &c., so that food may be served in good condition. Further down the northern slope of the hill is a building for the engines and dynamos, of which there are four, there being an installation of 1,200 lamps, and at a lower level is a battery of great boilers, six in number, for supplying steam to the engines and to the ranges in which the cooking is done, and hot water for the pipes by which the asylum is heated. At present only the eastern half of the building, along with the central block, is to

 GOLD MEDAL, Inventions Exhibition, 1885.

be opened, and that only in the meantime need be described. The western section, however, corresponds to the eastern in all respects. The whole building was designed to accommodate 150 patients, though it is believed there will be room for more than that number. The eastern half, therefore, represents an asylum of seventy-five beds. The Asylum buildings are three storeys in height. That portion nearest the central block runs east and west, while the end wings stand north and south. These, while opening into one another, are at the same time so arranged, structurally and otherwise, that they form what are practically four distinct wards in which classification of the patients may be made according to their mental condition. In each of the two principal floors of the portion of the building running east and west is a spacious gallery or corridor, 80 feet long by 14 feet in width, having a range of windows, on the south side, and on the other a row of bedrooms. Each ward has two parlours, commanding splendid views; about the centre of the corridor on the north side there is a projection, in which the lavatory accommodation is placed; and in a corresponding projection southwards are special rooms for noisy patients. Each ward has also attached to it a small kitchen, in which light food can be cooked. The wards running north and south are arranged on a somewhat different principle. The corridors there, each 45 feet in length by 9 feet wide, are placed in the centre of the block, and opening off them are seven bedrooms on each side, while the whole of the south front is taken up by two large parlours on each floor, 24 by 16 feet and 30 by 19 feet. In another corner of the ward is a private parlour with the windows in a projecting tower. The upper floors are entirely devoted to bedrooms, opening off corridors, as in an ordinary hotel. In the central tower are also a number of bedrooms. The upper section, however, is arranged as an arcaded belvedere, with the windows filled in with glass. The stairs throughout the building are of concrete, and though there are a good many of them, on account of the difference of the levels, they are all planned on easy gradients. The principal corridors have a dado of pale blue tiles. Though there are many rooms with open fireplaces, the heating of the Asylum is done by hot water on the low-pressure system, and the coils, specially made, are horizontal instead of vertical, which has certain advantages, and efficient ventilating arrangements are also introduced. The whole building, it may be further explained, is divided into small sections, so that any accident occurring to the electric-light wires, heating pipes, or water-supply pipes to baths and basins is confined to that particular

section alone. The main building is divided into ten separate sections by stone walls carried through the roofs in order to prevent the spread of fire. This has been accomplished without loss of architectural effect by raising portions of the buildings above the general height in low towers with flat roofs. In order to give means of ready escape in case of fire, every room can be reached by at least two staircases.

The scheme also included the erection of four villas and two hospitals, one on the east and the other on the west side of the main building. Both hospitals have been erected, as also three of the detached villas—South Craig, Queen's Craig and Bevan House.

The tenders accepted for the execution of this important building amounted to 65,494*l.* 6*s.* 5*d.*, exclusive of the cost of water supply, lighting, heating, drainage, painting, furnishing and other accessories which, it is believed, will run up the ultimate cost to 110,000*l.*, whereof upwards of 100,000*l.* have already been disbursed. Of this large expenditure there has been defrayed out of the receipts for patients' accommodation in the East House upwards of 33,000*l.*; the sum of 2,791*l.* has been met by the price of land sold to the railway company, and the balance has been raised in loan upon the security of the East House and Craig House. It is noteworthy that the extensive building operations connected with the new Asylum have been carried out without a serious accident or mishap to any of the numerous body of workmen employed. The contractor for the whole masonry and carpenter work of the new Asylum was Mr. John Lownie. The clerk of works was Mr. Perry, and Mr. Bryson was consulting electrical engineer.

BETTERMENT IN NEW YORK.

(Concluded from last week.)

THE committee of the House of Lords on Towns Improvements (Betterment) were enabled to obtain the evidence of a distinguished expert, General Egbert Viele, respecting the procedure adopted in New York in settling public improvements. The following are the principal portions:—

Chairman.

What the committee would like to know is this: Take the case of a clear improvement which has widened a street and made the houses more valuable for the purpose of letting or

any purpose you please, and that more rent can be obtained for them; the effect of that might be to render a smaller street in the immediate neighbourhood less of a thoroughfare, and therefore might make the houses in it of less value. Has that hypothesis ever been dealt with?—That hypothesis was not considered, in fact, on the line of improvement in the case of Worth Street. Streets on either side of it were also widened; Reed Street and Warren Street were all widened simultaneously within the same period, to prepare for the rapid approach of an increasing trade which took possession of it the moment it was opened.

Marquess of Salisbury.

Are the houses occupied by their owners or occupied by leaseholders?—The dwellings that were torn down had at one time been residences of a very respectable class of the community, but trade was driving them away, and they were occupied as tenement houses by an inferior class of population; in fact, a vicious class of population took possession of the old houses as fast as they became deserted by the other tenants before they became converted into business premises.

Then these occupiers who were turned out received no compensation for their eviction, did they?—None whatever.

Was the only person compensated the ground-owner?—It was merely a question of the value of the building destroyed and the value of the land taken.

And in the damage which this assessment for benefit was to recoup did you include the cost of making the road, or only the amount of compensation for the land and houses taken?—No; the cost of making the roadway is always assessed directly upon abutting owners everywhere. The roadway, pavement and the sewers are always assessed upon abutting owners; it never goes beyond them.

Then the levy for benefit was entirely expended in paying compensation for the land and the buildings upon it, was it?—Entirely so.

Lord Thring.

As I understand you, in the particular case you are quoting, no municipal money was advanced at all, was it?—None whatever.

The municipality advanced nothing, did they?—Nothing whatever; the property owners paid it all.

The transaction, in fact, was this, was it not. The city under a statute took a particular area of buildings, then they

sent commissioners to assess the benefit and damage, as you call it; and then they paid the persons entitled to the money out of the proceeds of the improvements?—Out of the proceeds of the assessments.

But they did not advance one sixpence themselves, did they?—Not one sixpence.

That is analogous to our way of doing it. In our case the municipality advance the whole of the money out of the municipal funds, and the question is whether or not they ought to repay themselves a certain portion of the sum so advanced out of the benefit which is proved to have ensued to certain owners by the improvement. Do you think that unjust?—There is a system of issuing improvement bonds by the city who pay in these instances, but recoup themselves from the assessment when it comes in. When an assessment is levied upon property the city issues improvement bonds in many instances, so as to pay the parties, and they afterwards receive this money back into the Treasury from these assessments which are levied. The city aids, in that way, by what may be called lending its own credit in issuing these bonds and redeeming them afterwards.

In the case you have given us the injustice was obvious, was it not; because they assumed that a particular area would, if improved, pay the whole of the expense?—Yes.

But supposing it had been put the other way; supposing the municipality had not assumed anything whatever, but had paid the whole of the expense of the improvement, and then finding that certain owners of the houses in certain areas had received very great benefit, would it have been unjust that they should have asked those owners to repay to them a portion of the great benefit they had received through the public money?—It would not have been unjust.

Lord Farrer.

Who fixes the area, the commissioners or the Legislature?—The commissioners.

Do the commissioners say that within a certain area land shall be taxed sufficiently to get that money back?—Yes.

The commissioners decide that, do they?—Yes.

Do they decide on the area?—Yes.

And have the commissioners not to determine at all whether it will be improved or not?—Not at all in detail.

Then is the problem before them this. Here is an improvement which is to cost half a million of money; that half a million of money has to be raised. Then they have to decide

ROOFING FELT.

Selly Park

on Birmingham

26th Sept '94

Dear Sir,

If you wish my opinion, I should strongly recommend you to use 'The Potter' Roofing felt. You know how much about felt as I do - I say quite you will then you know this one - and there are felt, and felt. 'The Potter' is called after the maker, Andrew Potter, of Wolverhampton.

Yours truly,

H. P. Naylor

upon a certain area, and say everybody within that area shall be taxed sufficiently to raise half a million of money?—Yes.

Is that the principle?—That is the precise principle.

Without any reference to the actual increased value?—Without any discussion of the details of the increased value of those pieces of property.

But do they form any opinion, or do they not form any opinion, as to whether that property has been improved?—None whatever; they cannot do it.

Then you told us that in this particular case the property had been so much improved in value by the building of marble palaces and otherwise, and the rates increased so much that the property was paid for over again?—The property on the line of the street improved so much in value that in the course of years the increase of rates amounted to about the same as the assessment of the damages.

Your general rates are high in New York, are they not?—Within 2 per cent. of the assessed value, which amounts to about one-half of the actual value.

Of the actual capital value. Your rates are based upon capital, are they not, not upon income?—They are simply on the value of the real estate itself; on the capital value, not on the rental.

Then you told us that the rates increased so much in consequence of the increase in value of the land arising from this improvement, that the increase in the rates in course of time would recoup the municipality for their expenses?—Yes, in the instance I refer to, of Worth Street.

Then in that case the value of the property itself must have increased, must it not, in a very much larger proportion?—Yes.

As the increase in the rates bears a very small proportion to the aggregate value of the property, that property must have benefited very largely by the improvement?—Yes.

Then where is the injustice if the city takes to itself some of the benefits which it has conferred on these people by the improvement?—The injustice I referred to was with regard to property a large area of which is assessed without any return whatever.

Do you mean the arbitrary nature of the area?—Yes.

But supposing the commissioners had selected that part of the property that was ultimately improved in value, where would be the injustice?—There would be the chance that the value might increase, and that it might not. In the case of Worth Street it did. There is a portion of Duane Street which is in the same condition to-day as it was forty years ago when it was widened, because the people had not the money to improve it.

Then the injustice consists, not in taking the money from the owners of the property which is benefited, but in taking it from the number of persons who are not benefited, does it?—Yes; quite so.

Marquess of Salisbury.

I want to ask you a question with reference to the leaseholders. I think you told me that nothing was paid to them for disturbance when the land was taken from them, but only to the ground owner?—I beg your pardon; in the case where people showed that they were deprived of their leases that was considered in awarding the damages.

And the amount was settled by the commissioners, I suppose?—Yes.

Lord Egerton.

I think you said that since the injustice in the carrying out of the Worth Street improvement had been felt so largely, other systems had been adopted of spreading the costs of certain improvements over the whole city?—Yes.

Is that now the normal state of things in New York, or do you still revert to what you have described as an injustice?—There is not a normal condition of things. Property owners who want to get improvements made frequently go to the Legislature, and use a certain influence and get large powers, which are all exercised at the expense of the city. There is no defined action; it depends on the skill or influence of the individual.

Do individual owners in New York never carry out improvements on their own account, either solely or partly, with the assistance of the municipality?—Not at all; not so far as streets are concerned.

There is no one, is there, like the Duke of Westminster, who would carry out an improvement on his own property on his own account?—There have been instances where the owners of property have arranged with the authorities to do the work of improvement at their own expense.

You spoke of improvement bonds. I should like to know in what cases they are issued; are they issued in the case of every improvement or only in the case of a certain improvement of a very large character?—They are issued to obtain the temporary use of money until it comes into the Treasury from the taxes.

Does not that seem to be the simplest and readiest way of

carrying out an improvement, to borrow the money on favourable terms and to repay it after a certain time by capital and interest, the rates paying the capital and interest as well?—The issue of those bonds is merely for obtaining the money to pay these owners until the tax comes in.

Do you mean the tax which will recoup the capital sum?—Yes.

You do not repay the interest over a series of years, then, do you?—The improvement bonds carry interest with them.

For how many years do they run?—Sometimes they run five years and sometimes ten years, but ordinarily the short improvement bonds run five years.

In that time does the municipality expect to recoup itself by the increased value or the increased taxation?—Yes, they loan the money; the city advances the money in order to see that there is no injustice done to whoever has property taken away from them, because it takes some time to collect this tax.

Lord Farrer.

These improvement bonds are sold in the market, are they not?—Yes; they are advertised, sold in the market and taken by the bankers.

And even sold in the City of London, I think?—I should think so; I should not be surprised; they generally bring a premium.

And they are charges on specific property, are they not?—No; they are charged on the property belonging to the city.

Is that so in New York?—Yes.

I have seen bonds from Chicago which have been charges on particular properties.—The credit of the city of New York is pledged in those bonds.

Marquess of Salisbury.

What interest do they bear generally?—Sometimes 3 per cent.; it varies; but bonds are readily taken at 3 per cent., and are very much sought after.

Chairman.

Is there any limit as to the power to make these improvements? Do you require an Act of the Legislature in each case, or is there any general system under which a particular body is entrusted with the power to make improvements?—The widening of these streets that I refer to originated with the council of the city; but the improvements at large, such as parks and boulevards, are done by a special Act of the Legislature.

Confining yourself for the moment to the question of the streets, is there any limit to the powers of the municipality to open a new street?—No; but they are generally governed by the express desire, through petition, of the owners of property along the line of the street.

I asked the question because I see the statute, which appears to date from 1807, appears to require as a condition that two-thirds of the owners along the intended street should concur in the desire that it should be done?—Yes.

Is that the law?—Yes; they must sign this petition, and it goes to the Council.

They must sign it, must they?—Yes.

Then the Council would have no power themselves to initiate it, would they?—No, they have not; they never initiate it.

Earl of Onslow.

You have had a very wide and long professional experience of the value of properties in New York, I understand. Supposing the commissioners were to ask you, as an appraiser, to give them an idea of the future value, the value for all time, of property which had been benefited by an improvement, do you think that you could state it?—I think not.

Do you think that would be impossible?—I would not dare to do it.

Lord Thring.

Supposing I wanted to buy a house in New York tomorrow, would you object to appraise the value of it?—Not at all; I would be very happy to do so.

Without calculating for all time?—I would give an opinion for its immediate future without any hesitation.

But you would not go into the eternity question, would you?—No.

Chairman.

I should like to ask upon that, would the value you would give have reference to its existing value for sale at this moment or to future speculation?—I have been frequently asked to appraise the value of property, and have appraised it to the extent of many millions in the city of New York. I do not, as a general rule, base my opinion upon what it would sell for at that time, but I base it upon my experience of what has been the general character of the improvements. The real estate agents as a rule quote sales in improved neighbourhoods, but I have pursued a different course myself, and I think I may safely say that I have very seldom made any mistakes.

FIREPROOF CURTAINS.

MESSRS. MERRYWEATHER & SONS, of London, have recently carried out contracts for fitting several places of amusement with fireproof curtains. At the new Theatre Métropole, Denmark Hill, and also at the new London Music Hall, Shoreditch, this firm has constructed curtains, consisting of strong wrought-iron frames covered with asbestos cloth on both sides, and arranged to be lifted by a crab and winch. The curtain is almost balanced by counterweights, and can be lowered very rapidly in case of fire. Connection is made to the water-service, and special spray jets are fixed over the proscenium opening, and an automatic attachment, which is put in gear during performances, opens a valve and allows water to play upon the curtain as soon as it descends, thus keeping it wet and materially improving its fire-resisting qualities. Messrs. Merryweather have also introduced an iron curtain of similar construction, fitted with winch or with hydraulic cylinder

MANCHESTER MUSEUM LECTURES.

THE concluding lecture of the first popular course by Professor Boyd-Dawkins, upon "Prehistoric Civilisation in Western Europe," was given in the Chemical Theatre of Owens College. Taking for illustration "The Contact with History," the lecturer explained how, during the age of bronze, the hunter and the herdsman was succeeded by a race of people who, with better weapons and instruments, acquired in Gaul and the British Isles a fuller mastery of the arts of peace and war. The dagger was lengthened out to form a sword, the spear was introduced, the axe (with handle firmly fixed in the head, as contrasted with the neolithic axe in which the head was invariably inserted into the handle), and arrow tips, still of flint, became more efficient for their purpose. The habitation, traces of which are found in Anglesey and other parts of Wales, now began to have some resemblance to the modern house, being circular in plan, with a conical roof formed of turf or straw.

and pistons for lifting and lowering with water taken from the street mains. A third arrangement specially provides for buildings not having the space above the stage to allow of a rigid curtain, and consists of special woven asbestos on iron rollers and provided with suitable lifting-gear. One of these was fitted by the firm some months ago at Doncaster Theatre, and has been found very satisfactory. The accompanying engraving requires no explanation, showing as it does so well the general arrangement of 'Merryweathers' Improved Hydraulic Fireproof Curtain.

A LARGE clock has just been placed in the parish church of Whittle-le-Woods, near Chorley. It is fitted with all the latest improvements; there are three 6-foot dials and the hours are struck on a 10-cwt. bell. The work has been carried out generally to the designs of Lord Grimthorpe by John Smith & Sons, Midland Clock Works, Derby.

and with a hole at the summit for discharging smoke. The art of the bronze-using people was also described as evidenced by the form and ornamentation of cinerary urns, drinking cups, bowls and personal ornaments. Greater attention was paid to dress and appearance; pins were used, often bent to give more secure hold, and also the safety pin, the forerunner of the brooch. The mode of sepulture, the religious belief as indicated by the remains of their temples at Ebury and Stonehenge, were also detailed. Later, the use of gold and enamel came into vogue, and the employment of amber in jewellery. In the next age the use of iron became known, and the knowledge of the capabilities of the master metal of civilisation led to a general outgrowth in human affairs. Immediately prior to the historic period coinage was introduced, betokening an advance in commercial transactions. During these changes the individual gradually became merged in the family, and distinct tribes were ultimately formed, foreshadowing the organised effort which, in the Saxon Heptarchy, assumed a more complete development.

GLASGOW MASTER WRIGHTS' ASSOCIATION.

At the quarterly meeting of this Association, Mr. A. M'Farlane, president, in the chair, a paper was read by Mr. John Gordon, ex-president of the Glasgow Institute of Architects, the subject being "Observations on some Structural Details of Buildings." The speaker advocated a more extensive use of concrete in ordinary house building. It should be used in the case of all foundations. He thought the time was ripe for considering whether some modification of the fireproof concrete floor could not be applied to ordinary dwelling-houses. As regards the cost, he had made some calculations and had found that by paying 10s. extra rent the tenant of a three-room-and-kitchen house might have the advantage of a concrete floor which would be practically fireproof, sound-proof, smell-proof and vermin-proof. He believed that for these advantages many tenants would very gladly pay the extra rent. He was opposed to the use of wooden safe lintels in brick or stone walls now that iron and steel are so cheap and accessible. He would have all safe lintels of metal. He disapproved of lath and standard partitions except in the case of shops and warehouses, where they might very well serve as temporary arrangements, but in dwelling-houses he would insist upon all partitions being built of brick. A standard partition, however well it might be deafened, was less impervious to sound than brick. It was also the cause of much cracking of the plaster through shrinkage of the timber. He thought that a main defect of the lobbies in tenement houses was their want of light. He would insist upon the upper flat houses, where they could not otherwise be lighted, being lighted from the roof, and the lobbies below from borrowed lights in the walls above the levels of the door lintels. He enlarged upon the necessity of all plumbers' pipes and fittings being left naked, open and above board. The present practice created inaccessible corners for the accumulation of dirt and other nuisances. It prevented defects from being discovered until sometimes much mischief was done, and when discovered it often involved trouble and expense to repair the damage. It was a false sentiment that pipes and fittings were so essentially ugly that they could be made to look well. He thought the edict of the Dean of Guild as to opening windows a wise and salutary one. The main difficulty in carrying it out was the devising of a sash combining the three requisites, strength, simplicity and cheapness. The problem was being attacked on all sides and by all sorts and conditions of men, and probably we should ere long have a

solution that will commend itself to general acceptance. He referred to the term "jerry buildings," sometimes applied to erections in Glasgow. He thought it a misnomer. Whatever there might be in the south, where terraces were run up in a few weeks, there were certainly no "jerry buildings" in Glasgow, where six or eight months is the shortest time for the erection of a common tenement. The building regulations which had obtained here for the last thirty years or more had effectually prevented the erection of "jerry buildings." A discussion followed, and, on the motion of the Chairman, Mr. Gordon was cordially thanked for his paper.

CABLEWAYS.

A LECTURE was given in the Town Hall, Brighton, on Monday, by Mr. Brewer, the engineer of the new Dyke Cableway, on the "Development of Cableways." He said he did not claim that it was an entire novelty, but he had improved what had been tested elsewhere. Mr. Brewer explained how the cars could not be worked on the old system when a wind was blowing, whereas a gale made no difference in the working of his system, which could do any distance and took the easy grade of an ordinary railway, the movement being perfectly smooth. Mr. Brewer mentioned that since the opening day 3,000 persons had crossed in the Dyke car, and of that number only one female and two men had objected to it; indeed, his greatest friends were the ladies, many of whom had spoken of the pleasantness of the journey. Nevertheless, this was merely a prelude to what he was going to do in perfecting the system, when it would be not travelling but flying, and he hoped to take people from Brighton to Paris in three hours. It was in contemplation, he said, to make a cableway in Brighton, so that people might be conveyed from the Brighton Station to Sussex Square in $7\frac{1}{2}$ minutes at a cost of 3d.; and he showed by plans, &c., how this was to be done. The passengers would, in one part of the journey, be 300 feet above the ground, but as there would be frosted glass in the car, they need not look out unless they liked. Although the car would go up the steepest hill, there would be no shaking, not so much, in fact, as on an ordinary railway, and if the passengers were to shut their eyes they would never know whether they were going up or down. After what he had done at the Dyke he did not think anyone would doubt his ability to carry out this undertaking. Votes of thanks were given to Mr. Brewer for his lecture and to the Mayor for presiding.

THE MOST PERFECT AND RELIABLE SYSTEM OF

VENTILATION AND HEATING FOR SCHOOLS, AND EVERY CLASS OF BUILDING.

The air of Class-rooms renewed every six minutes in all weathers positively and without draughts, no foul air anywhere; for a school of 1,000 68 tons weight of air impelled into it every hour. All buildings ventilated and warmed mechanically. No failures nor breakdowns.

GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

THE NEW NORTH BRIDGE, EDINBURGH.

THE Lord Provost's committee of Edinburgh Town Council have obtained explanation from the engineers in reference to the tenders sent in for the construction of the new North Bridge. With this information before them, they resolved to recommend the Council to accept the offer of Sir William Arrol & Co., the amount of which is 81,894/-. It is understood that the sub-contract for the masonwork is to be given to Messrs. William Beattie & Sons, builders, Edinburgh. The design which will be followed shows a handsome bridge of three spans, each span being 175 feet. The new bridge at its north end will spring from the south wall of the Post Office building, and the southernmost span will be carried over Jeffrey Street, which, it will be remembered, was crossed, according to the former design laid before the Town Council, by a small arch. The new bridge will have a uniform width of 75 feet between the parapets, which is practically the same width as the present North Bridge Street at its most northerly part. Except the piers, which will be of masonry, the structure will be entirely of steel, with ornamental cast-iron face-work. The plans approved of provide for a uniform gradient from the Post Office to the High Street, which reduces the present gradient of 1 in 18 to 1 in 27. The scheme necessitates the taking down of the blocks directly at the south end of the present bridge, on the east and on the west side of the street, and another important improvement effected is the additional width of the new bridge as compared with the existing structure—75 feet as compared with 54 feet between the parapets.

THE AUCTIONEERS' INSTITUTE.

THE session 1894-95 of the Auctioneers' Institute of the United Kingdom (Incorporated) was opened on Tuesday at 63 Chancery Lane, when Dr. Heber L. Hart delivered an inaugural address on the subject of "Legal Restraints on Auction-room Ingenuity." Mr. F. Everill (Worcester) presided, and was supported by Mr. James Catling (Cambridge), vice-president; Mr. George Brinsley and Mr. E. W. Richardson, members of the council; Mr. Allen Drew, Mr. R. Peck, Mr. H. P. Norris and a large number of fellows and associates of the Institute in London and the provinces. Dr. Hart said that as soon as the auctioneer left his facts and gave scope to his imagination he must be careful, as a matter of legal obligation, to confine himself to generalities, and must scrupulously

eschew particularity of statement. Without special authorisation he must not allow himself to be entrapped into giving a warranty, otherwise he might become personally responsible to the purchaser. Any deliberately pursued design to disparage the property which was put up for sale on the part of one who subsequently became the highest bidder would entitle the vendor to set aside the sale. It seemed, therefore, clear that the auctioneer need not accept the bid of anyone who had intentionally disparaged the property, and also that an action would lie for any special damage sustained by the vendor in consequence of such depreciation. Bids which must be refused were those made by the vendor or his agent, unless the right to bid was expressly reserved. Puffing was now illegal in all cases. Where the sale was simply announced to be subject to a reserve price no bidding on behalf of the vendor was permissible. In the case of a sale by trustees, a bid by any of them must be refused. The auctioneer must not make a pretence of receiving bids which were not, in fact, made. If he did he might find himself made a defendant to an action by the purchaser, in which he would be liable to repay the deposit with interest and the costs of the action. A bid by the auctioneer on his own behalf could not be maintained as against the vendor if he declined to complete, and as against the next highest bidder in the case of a sale without reserve. A discussion followed.

BUILDING LAND IN SCOTLAND.

THE parliamentary committee on "Feus and Building Leases" in their report offer the following remarks on building sites:—

Although the ordinary tenure upon which land is acquired for building purposes in Scotland is feu, building leases, usually for a term of ninety-nine years, are not uncommon in certain localities, and it has been the custom in some rural villages and fishing communities, especially on the north-east coast, to build dwelling-houses upon land held without any written title, which would, in legal estimation, be held to import a right of lease from year to year only.

According to the law of Scotland, where buildings are erected upon ground held on lease, these buildings, in the absence of express stipulation to the contrary, become part of the soil, and belong to the proprietor upon the expiry of the lease. In the case of long leases this is felt to be a hardship. If the lessee makes no new arrangement with the lessor and quits his holding at the expiry of the lease, he has to leave the

ENLARGING AND MAGIC LANTERNS.

"OPTIMUS" ETHO OXYGEN SAFETY SATURATOR.

Price complete with Jet, 70 - each.

FREDERICK E. IVES, of colour photography fame, said in a recent address:—"In my opinion the best of these inside-lantern saturators yet produced is that of Perken, Son & Rayment, of London. . . . It will not become unduly heated in the lantern, as some of the others might, and is a model of completeness and convenience. I think so much of it that I have adopted it for my own use."

"OPTIMUS" 100 CANDLE-POWER LAMP.

Price, Three Wicks 2 in. wide, with Lantern complete, 65 - each.

Nature.—"Lanternists will be glad to learn that Perken, Son & Rayment have introduced a new oil lamp, possessing THREE TIMES THE CANDLE-POWER of those hitherto used for lantern projection. For small audiences the lamp will suit a lecturer's purpose quite as well as the limelight."

buildings to the lessor without receiving any compensation for them. If, on the other hand, he arranges for a renewal of the lease, the existence of the buildings is taken into account, and he has either to make a capital payment or to submit to an increase of rent in respect of them under the new lease. If, again, he arranges for a conversion of his tenure into feu, he has practically to purchase at a capital price the buildings which he has himself erected, or to pay for them by a feu duty fixed at a higher rate than would have been exacted if the buildings had not in legal estimation belonged to the lessor. It appears from the evidence that in various localities in Scotland there is a considerable feeling that some legal remedy should be provided for this state of things, and that the lessee should be entitled to have his tenure converted into a permanent one upon fair terms.

The other case, viz. that of buildings being erected upon ground held upon tenancy at will, and without any written title, is less common, though some rural villages and the fishing communities on the north-east coast of Scotland afford illustrations of it. No evidence was submitted to the committee that in either case the rights of the lessors have been unduly pressed, and although the lessees appear generally to have enjoyed practically, though not as a matter of legal right, reasonable permanency of tenure, the evils resulting from insecurity of tenure are more or less felt.

As it is well known that the erection of buildings, often of very considerable value, upon ground to which the persons erecting the buildings have no permanent, and sometimes no written, title, is common upon the north-east coast of Scotland, the committee expected to have had more evidence upon the subject. The evidence submitted to them in regard to it was very slight, and consequently it was not thought necessary by those who may be supposed to represent the lessors' interest to adduce counter evidence. The committee, therefore, would not feel warranted in proceeding much, or at all, upon the evidence which they have heard on this point, but would prefer to deal with the question upon considerations of general policy.

As has been already stated, the ordinary tenure of building land in Scotland is feu, whereby a permanent right is acquired, and consequently the question of what is generally known as the enfranchisement of leaseholds is not so important in Scotland as it is in England, where the prevalent tenure of building land is leasehold. But the same considerations of public policy enter into the question as it arises in both countries, and in dealing with the Scotch case it is important to keep in view what

has occurred with reference to the analogous case in England. The Royal Commission on the Housing of the Working Classes, in their Supplementary Report, recommended "that legislation favourable to the acquisition on equitable terms of the freehold interest on the part of the leaseholder would conduce greatly to the improvement of the dwellings of the people of this country," because "the prevailing system of building leases is conducive to bad building, to deterioration of property towards the close of the lease, and to a want of interest on the part of the occupier in the house he inhabits," and because "the system of building on leasehold land is the great cause of the many evils connected with overcrowding, unsanitary buildings and excessive rents."

In like manner the town holdings committee, in their final report, recommended the local application of enfranchisement generally on the following grounds. "After the statements made before us by various witnesses, we cannot doubt that the ownership by a working man of the house he occupies is one of the strongest inducements to those habits of life which make him a good citizen and a useful member of the community, and that this stimulus is more strongly felt in the case of a man who has, or can obtain, the freehold than in that of a lessee for a term of years." Further, "with regard, however, to improvements which lessees holding under existing leases may hereafter desire to make, a measure of enfranchisement would place such lessees in a better position by enabling them to acquire the freehold before making the contemplated outlay. So far as the power of enfranchisement would promote such improvements, it may be looked upon as a benefit to the public." They therefore recommended the local application of enfranchisement generally. It appears to the committee that these considerations of general policy are applicable to Scotland as well as to England, and they therefore advise that provision should be made by legislation for the enfranchisement of building leases in Scotland, whether these leases are for a term of years or upon a tenancy at will.

Two methods of bringing about this result might be adopted either (1) by compelling the lessors to sell the value of their interest for a present capital payment, or (2) by providing that the lessee should obtain a permanent right of feu upon his becoming liable for such feu duty as would fairly represent the value of the rights which the lessor has in the subject when enfranchisement is claimed.

The lessor might be required, upon receiving a notice from the lessee, to estimate the present value of his interest, the

Seven years from Invention up to April 1890 over 11,300 sent out. But Up to the end of 1893, over 23,000 sent out.

A PERPLEXED GAS INSPECTOR.

"There has been so great a reduction in our consumption of gas at Speke Hall, Battersea, since we had your CLAPTON LIGHTS, that the Gas Company declared our meter must be out of order. They have had it examined, and can find nothing wrong."

R. H., London, September, 1893."

The Gas Light also at this Hall is said to be over twice what it was before.

J. C. HALLIDAY, 12 GRAINGER STREET, INVENTOR AND MANUFACTURER, NEWCASTLE-ON-TYNE.

A LIST of ART PLATES published in "THE ARCHITECT" will be forwarded on application to P. A. GILBERT WOOD, Publisher, 175 Strand.

lessee desiring enfranchisement at the same time giving a statement of what he considers the fair value of that interest, and if they could not come to an agreement the difference between them might be authoritatively and finally settled by statutory arbitration. The consideration to be paid by the lessee, whether it was a capital sum, as for an out-and-out purchase, or a feu duty, as for a permanent right of feu, could be easily settled by an arbitration tribunal.

If the lease contained building restrictions, or obligations agreed to in the interest of the lessor as such, or in the interests of the adjoining lessees or other persons, such restrictions might be duly conserved, either in the conveyance which the lessor would grant to the lessee, as upon a purchase, for a payment of a capital sum, or in the feu grant which he would execute, if it was decided to convert the leasehold right into a feu.

The next question to which the committee would advert is one which has long excited much interest in various parts of Scotland. It is alleged that there are towns and villages situated upon the property of proprietors who do not desire the extension of the towns or villages, and decline to give land, either for building houses or for industrial purposes, in their vicinity, either absolutely or on lease, except upon prohibitive terms. The effect of this is said to be not only to prevent the natural expansion of such communities, but to lead to their decay, as in these days, if a community does not advance, it is almost certain to retrograde.

Such a state of things is, in the judgment of the committee, a public evil demanding remedy by legislation.

The remedy which the committee would suggest is that the local authority, whether town council, county council, or other elected body, should be empowered to purchase land by agreement, or compulsorily, for the purposes either of providing sites for dwellings for workmen or other persons, or of otherwise providing for the present or prospective development of the town or village. It appears to the committee that, subject to the review or control immediately afterwards suggested, considerable latitude might be left to the local authorities, both as to the purposes for which the land might be acquired, and as to the manner in which it should be dealt with when acquired, whether by letting on lease, feuing or selling, to the persons by whom it was to be occupied. It might be provided that before a local authority should proceed to acquire land for the purposes in question, it should issue notices to apprise all persons interested of what was proposed, and that any rate-

payer within the area of the local authority should be entitled to represent to the Secretary for Scotland, or to the Board proposed to be constituted under the Local Government (Scotland) Bill now before Parliament, against the contemplated acquisition of land. If, in the judgment of the Secretary for Scotland, or the Board, sufficient grounds should be established for prohibiting the proposed acquisition, the Secretary for Scotland or the Board should have power to prohibit it.

Machinery for the acquisition of land, simpler and less expensive than that prescribed by the Lands Clauses Acts, might be provided, as has been done in the Parish Councils Act for England, in the Local Government (Scotland) Bill and in other Bills now before Parliament.

A question has been raised as to whether provision should be made for the compulsory acquisition of land for building dwelling-houses for public officials. The committee hope and believe that very few proprietors in Scotland would decline to give, upon reasonable terms, land which might be required as sites for dwelling-houses for the public officials concerned in the administration of justice, the investigation of crime and the preservation of the public peace, and they would not feel warranted in making an affirmative recommendation in the direction sought, in the absence of evidence that it is necessary.

THE PROPOSED HOSPITAL, EDINBURGH.

A REPORT by the College of Physicians on the various possible sites for a new city hospital has been circulated among the members of the public health committee of the Edinburgh Town Council. The conclusions which the committee of the college charged with the inspection and consideration of the sites have arrived at are as follows:—The proposed extension of the present City Hospital to the east is inexpedient for the following reasons. First, the site proposed to be acquired is on a much lower level than that occupied by the present buildings; second, the area of ground, including the site of the present hospital, being altogether only eight acres, is not sufficiently large for present requirements, and still less for future extension; third, it is inconvenient in position and form for a proper arrangement of the buildings, and the proposed connection by a bridge over the Pleasance, in the opinion of the committee, would be highly objectionable; and, fourth, it is in the midst of a dense population, and is in awkward proximity to blocks of building which cannot be removed,

there being on both north and south sides large buildings connected with breweries which project into the site, narrowing it towards the east. Having regard to these objections, the committee have turned their attention to other available and suitable sites. In view of the fact that a fever hospital is being erected for Leith on the north side of Edinburgh near East Pilton, which would, in the event of union between Edinburgh and Leith for public health purposes, be a most convenient position for the northern districts of Edinburgh, the committee are of opinion that the best site for a new hospital would be one similarly situated in a convenient position on the south side of the town, which would correspondingly meet the requirements of the southern districts. Several such sites are available. The two which have commended themselves to the committee are the following:—First, an area at South Grange, including Craigmount Cricket Field, with the large dwelling-house of South Park upon it, Grange Terrace with garden grounds attached, and the road between the terrace and the field, which would be thrown into the grounds. The buildings thus acquired could all be utilised for administrative buildings, nurses' homes and servants' quarters. This site is about 17 acres in extent. The burgh engineer reports that "the upper subsoil is of an open gravelly nature, inclining to gravelly clay in the lower strata. The drainage is good; the sewer, which is good, has a powerful flow. The locality is not specially more subject to fogs or mists than any other quarter. The site has a gentle slope towards the south, and has thus a good exposure to the sun;" and "the situation is an airy one." It is equidistant from the Canongate and Dalry districts, and is only fifteen minutes' walk from the Royal Infirmary and New University Buildings. From the extent and open character of this site a fever hospital built upon it would not, in the opinion of the committee, have any injurious effect on the health of the surrounding community. Second, a site on the eastern slope of Blackford Hill to the south of the road leading from the Harrison Arch to Blackford Hill—about thirty acres in extent. This site has a good exposure, is not near any private residences, and is sufficient in area for an hospital built on the most approved principles and for future extension. It is, however, at a greater distance from the more populous districts of the city, and from the medical schools. The committee recommend that one or other of these sites should secured, be the former being for all purposes the most suitable. Other sites at Corstorphine Hill and in the Morning-side district have been considered, but these are not so con-

veniently situated either for the public or for the medical schools, and are therefore, in the opinion of the committee, less desirable. The committee have further had under consideration a proposal to retain the present hospital for certain of the fevers, especially typhoid fever, and to treat others, such as scarlet fever and measles, in a new hospital; but they are of opinion that such a proposal should not be entertained.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

19538. Charles Milne and Robert Barton, for "Improvements in and connected with sliding sash-windows."
 19553. Robert Henry Harvey and John William Blythe Unwin, for "Improvements relating to sash-fasteners for windows and safety-catches for door latches."
 19574. William Youlten, for "Improvements in sliding sash-boxed frames."
 19787. Joseph Breeden & Co., Limited, and Francis Breeden, for "Improvements in flushing apparatus for water-closets and other places."
 19795. Cuthbert Burnett, for "Improvements in the so-called Forster pipe joint."
 19813. Stanley Cooper, for "An improved method of attaching sash-cords to windows."
 19829. John Tullock, for "Improvements in tubular bricks or blocks and wall linings for fireproof buildings."
 19933. Matthew Joseph McNamara, for "Improvements in flushing cisterns."
 19984. William Edward, for "Improvements in or connected with water-closet flushing cisterns and their valves."
 20031. Ferdinand Müller, for "Lid with self-acting peat-mould distributing arrangement for closets?"

No. 234.

WASH-OUT.

"How to Drain a House," from a paper by T. MELLARD READE, ESQ., C.E., F.R.I.B.A., read before the Liverpool Architectural Society:—"I consider the pan-closet objectionable, especially since the introduction of the two-gallon regulating cistern has increased the difficulty of getting the after-flush to fill the pan. The 'container' is usually a reservoir coated with filth, hidden by the pan holding the water in the basin. A basin with a trap at the side or back, called a 'WASH-OUT' basin, is a far better apparatus."

"Improvement on Sanitary Condition of Houses," from a paper by J. CORBETT, ESQ., read before the Social Science Congress, Manchester, 1879:—"We replace defective Closet Appliances by the simple 'WASH-OUT CLOSET,' which is of white earthenware, without any valve, and so perfectly self-cleansing as to require very little attention."

Extract from a letter by "M. O. H.," a Medical Officer of Health, *Daily Telegraph*, September 22, 1880:—"The Local Government Board forbids the use of these pan-closets. . . . They may be easily replaced by one of the 'WASH-OUT' CLOSET Basins."

Extract from a lecture by W. EASSIE, ESQ., C.E., at the International Health Exhibition, May 28, 1884:—"A cleanly 'WASH-OUT' Flushing Rim Basin in connection with a small Flushing Tank overhead which merely required a touch of the depending chain and ring to liberate the whole contents."

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

Lantern Lights,
Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No. 208.
Special thrust
motion round
section Bolt,
suitable for ver
narrow stiles.
It can be fixed
where the spac
is insufficient
for anything
else. This Bol
is neat, strong
and reliable.

TRADE NOTES.

THE Carlisle city authorities, through their surveyor, Mr. W. Howard-Smith, C.E., have given instructions to Messrs. Wm. Potts & Sons, of 13 Guildford Street, Leeds, and 22 Collingwood Street, Newcastle-on-Tyne, to make and erect a new illuminated turret clock with four external dials in the tower of the Tullie House, or fine art gallery, which is one of the finest in the kingdom. Messrs. Potts made the clock for the new markets, which has given every satisfaction to all concerned.

THE Altofts Schools, near Wakefield, are being warmed and ventilated by means of Shorland's patent Manchester grates and stoves, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

ONE Grinnell sprinkler was set in action by a fire (and immediately extinguished it) that occurred on September 27 in the scutching room of the Hill Top Cotton Mill Company, Limited, Burnley. Loss, 15/. The firm are highly pleased with the efficiency of the Grinnell.

THE tender of Mr. Frank Robinson, Thornton, for the construction of works required for dealing with sewage has been accepted by the Thornton Local Board for 3,057/. Conditionally, thirteen tenders were received.

WE are informed that Mr. George Jacques, of Spring Bank, Silsden, has given instructions to the architects, Messrs. Bailey,

of Bradford and Keighley, to raise the tower of Silsden Parish Church, Keighley, and place a spire on the top of the above, and also instructed Messrs. W. Potts & Sons, of Leeds and Newcastle-on-Tyne, clock manufacturers, to make and fix a clock with four external illuminated dials and Cambridge chimes in the same.

VARIETIES.

IT is not often so compact a building estate is obtainable as the one which will be offered for sale by Messrs. E. & H. Lumley on the 20th inst. The freehold house, "Ivy Lodge," and grounds containing 1 acre 3 roods 16 perches will be then sold at the Mart unless previously acquired by private treaty. The lot is an almost unique piece of open ground, for it has a frontage to the Fulham Road exceeding 300 feet, and it is needless to say that in the district houses are eagerly sought.

AT the meeting of the joint committee of the members of the Droitwich School Board and the managers of the National schools held at the Town Hall, Mr. Sheppard, Worcester, architect, produced plans for a new school to be built at an estimated cost of 1,450/, and alterations and additions to the present schools of 1,150/. The Rev. E. M. Barnly said he would be responsible for 1,000/. Mr. Corbett has given the site, and the subscriptions reach 1,600/.

THE interest in the Claridge's Hotel sale has been kept up with spirit, the same faces appearing day after day. Many of the aristocracy attended or were represented, and bidders were attracted from Paris, Berlin and America, also from various parts of the provinces in large numbers. Many of the lots were comparatively unimportant, but any lot possessing interest was keenly competed for. We are pleased to inform our readers that the beautiful specimen of seventeenth-century carving, lot 524, the carved mantelpiece and overmantel, is to be retained in this country to be utilised in the new hotel, at the desire of his Grace the Duke of Westminster, the freeholder. Commencing at 5 guineas the biddings were prompt and spirited, and the hammer fell amid considerable applause at 180 guineas. One of the smaller Louis Seize clocks went for 10½ guineas (Parker). The Empire clock the auctioneer considers was given away for 15 guineas (Flumeg), as was also a portrait of a lady, by Romney, lot 362, for 26 guineas (Tooth); lot 965, a small picture by De Franck, 45 guineas (Bradford); lot 551, carved oak cabinet, 34½ guineas (Spillman). The sale of the

more important items, including the appointments of the Royal suite of apartments, the antique plate, old Sheffield plate, objets d'art, &c., commenced on Monday, the 5th. The rostrum has been occupied during the whole of the week by Mr. George A. Bickerton.

THE Mersey Dock Board have confirmed the recommendation of the warehouse committee that hydraulic power should be applied to three hand cranes and that a hydraulic press should be provided for tobacco at the King's Dock tobacco warehouse, at an estimated cost of 350/.

AT the meeting of the Altrincham Local Board a letter was read from the Local Government Board sanctioning a loan of 3,500/ for work of street improvement, and of 1,100/ for the completion of the free library and technical schools. It was decided to apply for sanction to a loan of 2,500/ for land and buildings for a town's yard.

AN inquiry has been held at Walsall with reference to an application on the part of the Town Council for sanction to a loan of 12,450/ for the purposes of street improvement and sewerage, for the purchase of a steam fire-engine and the extension of a fire-brigade station, and for the purposes of a public pleasure ground.

AT Carlisle Dr. Hair was prosecuted for having failed to comply with a notice served by the Urban Sanitary Authority, requiring him to disconnect the drainage of his house from an old brick sewer at the back, which had become choked up, and connect with the main sewer of the city in the Crescent itself. The sewer at the back of the house was proved to be an old one, into which a number of properties are drained, and the bench held that by the Public Health Act of 1875 it became vested in the Urban Authority, who are now responsible for it. The summons against Dr. Hair was accordingly dismissed, with costs.

THE Swiss authorities have sanctioned the construction of the proposed Jungfrau railway. At its highest extremity it will be a tunnel rising in spirals in the interior of the mountain. It will end in a little rocky plateau on the western slope of the summit, the last ascent being finished by a lift. The narrow ridge at the top of the mountain is to be levelled by blasting.

THE War Office is making arrangements for the transformation of the old prison at Woking into infantry barracks, to be named Inkerman Barracks.

A LECTURE was given on Wednesday night, the 31st ult., in the Co-operative Society's Class-rooms, Accrington, by Dr. C. H. Wade, M.A., Oxford, D.P.H., on the plumber and his work, dealing in detail with the science and art of plumbing and the need for efficient registration of qualified men. The lecture was given under the auspices of the County Council for Lancashire.

AT Retford a Local Government inquiry has been held as to the application of the Town Council to borrow 2,000/ for the erection of baths.

A BUILDER in Paisley has been fined 5/ with the alternative of fourteen days' imprisonment, for erecting a house in which the height of the ceiling of the ground floor was only 9 feet 4 inches, while according to the plan it should have been 9 feet 6 inches; and also that the width of the close and staircase was 3 feet 9 inches, instead of 4 feet. It was explained that the builder had acted in mistake, as he had read the plan from brick to brick and from joist to joist, without allowing for plaster. It was also pointed out that, whilst the height of the upper floors could have been made 9 feet, they had been made 9 feet 6 inches. The Dean of Guild Court was, however, inexorable.

THE Mayor of Oxford (Ald. Gray) entertained the employés of Mr. Thomas Axtell, the contractor for the new Corn Exchange and Fire Brigade Station in George Street, at a "sumptuous repast."

THE total amount expended in rebuilding the nave, restoring the north transept and the partial restoration of the south transept of St. Saviour's, Southwark, is stated to exceed 31,000/.

A COMPANY is now being formed, with a capital of 120,000/, for the purpose of developing and working the Creevelea iron mines in co. Leitrim, as well as to utilise the raw peat in the manufacture of peat charcoal, not only for the smelting of iron ore, but likewise to manufacture the charcoal, so that it may be efficiently used for domestic purposes, a necessity much felt in Ireland, where all the coal of good quality has to be imported.

BETWEEN 200 and 300 unionist carpenters and bricklayers, who were employed by Messrs. G. Trollope, have struck work as a protest against the introduction of non-union labour. A special levy has been made in all the branches of the Building Trades Federation in order that a large sum of money may be in hand should a general strike take place.

A STUDENTS' Association in connection with the Institution of Civil Engineers has been formed in Leeds.

FOR some time past St. John's parish church, Egremont, has been undergoing a thorough process of cleaning, decorating, and extensive improvements. The beautifying has now been completed, and the church reopened. The decorative work carried out by Messrs. G. H. Morton & Son is most praiseworthy, and redounds to their credit. Assisted by their staff of artists, they have throughout worked with interest and demonstrated a large amount of knowledge and research in the symbolism of early Christian art.

THE INCANDESCENT GASLIGHT COMPANY, LIMITED.

THE new factory of this Company in Palmer Street, Westminster was open for inspection on Tuesday, and visitors were conducted round and, as far as time allowed, the process of manufacture of "mantles" explained. The system is Dr. Auer von Welsbach's incandescent gaslight system. One feature is the burning of ordinary gas with air admixed through a Bunsen burner, which can be screwed on to any ordinary gas fitting. A regulator attached to the burner counteracts effects from variations of pressure. Attached to the burner is the mantle. The manufacture of these mantles is a business in itself, ordinary cotton thread knitted into form. The first step is the conversion of cotton thread into long tubes by knitting machines, each armed with over one hundred needles. These strips are made in long lengths, and at intervals of about 5 inches a double texture is knitted, forming, as it were, joints where the cuts will be made for each mantle. The knitted product is washed in distilled water, stretched and carefully dried in convenient lengths. They are next impregnated or put through a special fluid preparation, the chemical components of which it is not necessary to mention, which imparts to them the requisite incandescent properties, passed between rollers and then sent to the drying-room, kept at a high temperature by gas stoves. Here they are hung on glass rods and are kept constantly turned. When perfectly dried the mantles are removed to another department, moulded to the proper form and mounted on little supporting rods. In the next operation care and skill are required. The mantles are burnt in a Bunsen

flame, when the cotton material is all consumed, leaving a skeleton of the mineral substances. They are then burned over a gas flame for some hours, first with a chimney on the burner and then without, after which the mantles are ready for use. In order, however, to preserve them the better when travelling and to enable them to withstand rough usage, they are toughened by being steeped in a special fluid, and packed separately in cotton wool in tiny circular boxes. The light is a most brilliant one and more adapted for outside purposes than inside, except where very large interior spaces have to be illuminated, as the heat given off is considerable. The chemical nature of the light may be judged of when it is mentioned that most beautiful photographs are taken by it. There is on the premises an immense stock of lamps, brackets, stands, shades, &c., but the company should also lay themselves out to work from special designs, when required, so as to suit the wishes of all clients.

HAREWOOD HOUSE.

THE Council of the Royal Agricultural Society—Sir John Thorold, the president, in the chair—entertained the Duke of Westminster, Sir Walter Gilbey and others, to dinner on Tuesday night in Harewood House, Hanover Square, the new premises into possession of which the Society has entered. There followed a conversazione, at which upwards of six hundred guests were present, including Lord Egerton of Tatton, Lord Coventry, Viscount Evelyn, Earl Faversham, Lord Cathcart, Lord Moreton, Earl of Jersey, Mr. James Lowther, Mr. Cecil Parker, Professor Brown, Sir Jacob Wilson, &c.

Harewood House, 13 Hanover Square, formed a portion of a much larger block purchased by the Duke of Westminster and Sir Walter Gilbey, who gave the Council the option of acquiring the portion they wanted, for which, the necessary alterations included, the Society have paid 30,000*l*. The mansion was the residence of Lord Harewood and was built by Richard Adams, one of the famous brothers after whom the Adelphi took its name. All the rooms are of handsome proportions and are decorated in the Adams style.

The whole of the extensive additions, alterations and restoration has been carried out by Messrs. Holland & Hannen from the plans and under the direction of the architect, Mr. Arthur Vernon.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (*i.e.* the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 1, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.
ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.
WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

FOUNDATIONS IN DEEP AND UNRELIABLE SOILS.*

AN article in the *Engineering Record*, of New York, on "Foundations of High Buildings," by W. R. Hutton, M.Am.Soc.C.E., &c., has reminded me that in the province of Quebec we have had several failures of an expensive nature to make good, due to faulty foundations, as at Joliette, St. Bazile, St. Casimir, Nicolet, &c., and in Upper Canada at Cornwall and elsewhere.

As it is more satisfactory to know exactly how the foundations of certain tall and heavy structures have been built than to learn from any treatise on the subject how they should be laid down, I shall first summarise Mr. Hutton's article as extremely interesting and instructive to the profession, and then allude to the Canadian cases mentioned. In New York the rock is at from 15 to 50 and 70 feet below the surface, and overlaid by yellow sand mixed with clay and containing pockets or beds of quicksand. Many buildings rest on piles driven to refusal, though not necessarily to, nor always to, the rock. Under the city building law each pile may be loaded with 20 tons. The permanent wet level is about that of high tide in the harbour, and piles, not to decay, should be cut off at or about this level, dry seasons and deep drains, which may lower it, being taken into consideration. When a gap occurs in the rock, and bottom cannot be reached, an arch is thrown over to carry the walls above it, as was done in the case of the Washington (Field) Building on Battery Place.

The method of founding directly on the sand is gaining favour. The Equitable Building and the Union Trust are so built with wide footings loading the soil to 2 and 2½ tons to the

square foot. The *World* and *Times* buildings have similar foundations. Older buildings at only a few feet below the surface have suffered, probably from the lateral flow of quicksand into deeper neighbouring excavations. The newer buildings are at too great a depth to render such a result at all probable. When test-pits are sunk and quicksand makes its appearance, endangering adjoining structures, concrete should be at hand to promptly fill the pit and prevent the danger.

To save the cost of 15 to 20 feet of underpinning to the old walls of contiguous buildings, the foundations of the Methodist Book Concern were built in alternate piers surrounded with sheet piling, the intermediate piers then put in, the whole arched over, and walls raised upon them. In the case of the Manhattan Life Insurance Building, 353 feet high above street level, with foundations 55 feet deep to rock—a total of 408 feet—piles enough could not be driven to bear the great weight. The system adopted was that of pneumatic caissons. Fifteen of them, of which eleven are square, varying from 13 by 13 feet to 21 by 26 feet, and four circular ones from 9 to 15 feet in diameter, cover some 4,000 square feet, or about half the area of the site. The collective area of the caisson is proportioned to the maximum pressure allowed by city regulations, namely, from 150 lbs. to the square inch (say 11 tons to the foot), the brick piers being somewhat smaller, as they may be loaded to 200 lbs. to the inch, 14½ tons to the foot. The caisson roof is strengthened with I beams. The whole area is excavated to 20 feet in depth below the Broadway level, and the caissons are sunk by means of compressed air 35 feet further to the rock. They pass through 12 feet of fine micaceous sand, layers of mud with sand, of silt, of clay mixed with sand, and a very hard conglomerate over the usual gneiss-rock. The caissons were sunk by excavating the soil beneath them from the inside, and by the weight of the brick piers simultaneously built upon them, and to avoid an inflow of quicksand which might occur when the air pressure was reduced by blowing out the semi-fluid material through pipes, it was decided in the beginning to remove all material in buckets through the air locks; but upon trial it was ascertained that the pressure could be maintained while blowing out by running the compression faster, and the soft earth was thus removed. It is to be noted that any flow of quicksand from outside the lines of the caisson might have caused settlements of the neighbouring buildings. When the caissons reached the rock they were filled solidly with concrete. "At the date of writing," says Hutton (September 1893), "nearly all the caissons had been sunk to place and no appreciable

CHICAGO EXHIBITION, 1893.—MAW & CO., LIMITED, have obtained Highest Awards for Tiles, Mosaics, and Architectural Faience.

MAW & CO. will forward their Pattern Books, with Special Designs and Estimates for every kind of Floor and Wall Tiling, on application. Patterns can also be seen, and particulars obtained, at the Show-rooms of their appointed Agents Messrs. W. B. IMPSON & SON, 99 St. Martin's Lane, W.C.

cracks had occurred in adjacent buildings, one of which rests on piles at the level of the general excavations (20 feet below street level, as already stated), the other on the natural soil several feet above." The cost of these 55-foot foundations is said to have been 10 per cent. of the entire cost of the building. A commendable feature in the Manhattan Life Building is the symmetrical distribution of the load upon each pier. Commonly, foundation walls are built upon the outside edge of the property, with the footings almost entirely inside the thickness of the wall, concentrating upon the outer edge of the foundation-pressures much above the average. In the Manhattan Life the supports are centrally or symmetrically placed upon the caissons, and strong steel girders extending from side to side of the building sustain the side walls in "cantilever," to borrow a form of expression from the French. The engineer-contractors of the building, Messrs. Soozsmith & Co., made an interesting application of the same method in founding the draw-pier of the Seventh Avenue Bridge, New York. This is a circular pier 59 feet in diameter. Their experience having convinced them that there was great risk of cracks in the masonry from irregular movements of a very large caisson, this one was made annular in plan, 59 feet in outside diameter and 10 feet wide. When sunk upon the site, cemented to the rock and filled with concrete, it formed a coffer-dam within which it was expected to build the masonry "in the dry" after the water was pumped out, but seams in the rock-bottom of the central space admitted water faster than it could be removed by pumps, and it became necessary to cover the bottom with a layer of concrete put in place under water, to close the seams and permit the completion of the pier.

In Chicago foundations are more difficult and costly, due to the fact that instead of only 30 feet to 50 feet, as in New York, there is from 60 to 100 feet of blue drift clay overlying the rock, a material having a greater avidity for water and containing beds of quicksand, and yet upon this soil Chicago boasts some of the highest buildings yet erected. Formerly platforms of timber were embedded in the clay, and piles rarely driven to the rock, but the great weight of recent structures requires that piles be driven to the rock, and the tops cut off below all future drainage, that they may be always "in the wet," or detached foundations under each wall and pier, with footings carefully proportioned in area to the weight to come upon them and to the resistance of the soil. The best practice limits the weight to 3,000 lbs. per square foot, or say $1\frac{1}{2}$ ton, but this is frequently exceeded. Some settlement is expected,

and it is sought by proportioning surfaces to weights as far as possible to render the settling uniform.

As the wide footings when of masonry must be built in high and narrow offsets, forming a truncated pyramid under each pier or wall, thus robbing basement floors of much of their height, the practice in Chicago and elsewhere, due to the comparative cheapness of iron or steel bars and beams, is to form the footings of tiers of these bars laid on a concrete foundation, each successive tier lying across or at right angles to the one below, or along and across the wall alternately; and as their greater transverse strength allows of a greater breadth of offset, the reduced thickness of the walls is reached more rapidly or in a lesser height, not exceeding from 18 to 30 inches, instead of from 7 to 8 feet in some cases where of masonry. The weight is said to be also thus reduced by about 4 per cent. of the load upon the pier. The bars or beams, sometimes of second-hand railroad iron, are first dipped in hot asphalt or tar, carefully bedded on and filled in, and covered with concrete to protect the metal from rust. Such a foundation is of course dependent on being at such a depth that the adjoining soil be undisturbed. As on account of the soft nature of the clay, as glazier's putty, it must flow laterally if not prevented from doing so, just as water supporting a vessel in a lock would do, or dry sand, any structure if not laterally retained by some solid surrounding. Some large buildings in Chicago have been erected upon a continuous platform of concrete, covering the whole area of the structure. The serious irregular settlement of a prominent public building constructed in this way, accompanied by cracks in the walls and in the concrete platform, has brought the method into disfavour. It has been applied with better results when the platform has been made with iron beams covered and protected with concrete.

It has been observed in Venice, a city founded on the marshy bottom of a lagoon, that many large buildings constructed in the fourteenth century and before, rest upon a platform of masonry broader than the building it supports. The masonry itself rests upon a bed of puddled clay which shows signs of a powerful artificial compression. These structures show no notable change, while many others of later date, built upon piles, show by numerous cracks the irregular settlements they have incurred. It is said that the tower of St. Mark's does not rest on piles.

A different method has been adopted for a part of the foundations of the new Stock Exchange in Chicago. The

foundation is generally upon piles about 50 feet long, driven into the hard clay which overlies the rock; next to the *Herald* building, however, which adjoins it, wells were substituted, lest the shock of the pile driven close to its walls should cause settlement and cracks. A short cylinder 5 feet in diameter, made of steel plates, was first sunk by hand, reaching below the footings of the *Herald* building. Then around and inside the base of the cylinder sheet piles about $3\frac{1}{2}$ feet long were driven and held in place by a ring of steel inside their upper ends. The material inside the sheeting was excavated, and a similar steel ring was placed inside their lower ends; by means of wedges the lower ends of the sheeting were forced back into the soft clay until another course could be driven outside the lower ring. This operation was repeated until the excavation had reached the hard clay about 40 feet below the cellar. In this material the excavation was continued without sheeting, in the form of a hollow truncated cone, to a diameter of $7\frac{1}{2}$ feet, and the entire excavation was filled with concrete. The wells are spaced about 12 feet. The loads upon them vary; some of them will carry about 200 tons, something less than 4 tons to the square foot. The material excavated was a soft putty-like clay to a depth of 40 feet, where a firm clay was reached, deemed capable of carrying the weight proposed. The rest of the foundation is upon piles spaced 3 feet between centres, to be loaded with about 30 tons per pile, similar piles having been tested to 50 tons at the Chicago Library foundation. They are driven with a Nasmyth steam-hammer without brooming, are cut off below lake surface, capped and filled in with concrete. A series of short transverse I beams distribute the load transversely, and longitudinal beams prevent local settlements.

The foundations of the Washington monument at Washington have heretofore been well described, but having been commenced in 1848, now some forty-five years ago, a description of the method employed may not be uninteresting or unimportant to the younger members of the profession. This structure, when I visited Washington in 1856, had obtained a height of 156 feet. The monument was commenced on a national subscription then limited to 1 dol. per head, to afford every citizen the advantage of contributing his mite towards honouring the memory of the great man whose name it bore, and I myself have the honour of being one of the original subscribers, the receipt for which, of the size of an ordinary bank-note engraved on white paper of the consistency of a Bank of England note, with a cut of the finished monument at one end of it, I probably still have in one of my souvenir

albums. Almost every nation of the earth had contributed a souvenir in the shape of a block of its most precious stone or marble bearing a fitting inscription, and which were so placed as to be seen and felt and read by every one ascending the inner stairway, reaching at the time of my visit to the then top of the structure, and intended to be continued upwards to the full height of 600 feet then proposed; while hundreds of similar blocks from all the crowned heads of Europe, not excepting His Holiness the Pope—blocks of solid copper and nearly solid gold and silver and the like were either encased in the monument or lay strewn about the ground, awaiting each its turn to do honour to the "Father of his Country," the hero of liberty and independence.

At the date of my visit the works had been for some time interrupted, owing to unequal settlement of the foundation. In 1878, says Hutton, the work which had been in the hands of the Washington Monument Association was turned over to the general Government and completed with money appropriated by Congress. The work as finally constructed is a plain shaft 500 feet high with a pyramidion on top of it 55 feet in height. The shaft is 55 feet square at the base, 30 feet at top, the interior being say 20 feet in diameter and weight over 90,000 tons. The original foundation was of rubble masonry in lime mortar, $23\frac{1}{2}$ feet thick and 80 feet square at the base, the footings thus projecting $12\frac{1}{2}$ feet all around beyond the outer lines of shaft. The soil upon which it rested was a sandy clay; 13 feet below this was a bed of gravel. The area of the base was too small, and the soil under it not sufficiently resisting to carry the final weight. A mass of concrete $13\frac{1}{2}$ feet thick, extending 23 feet 6 inches outside of the old base and 18 feet under it, increased the bearing surface and carried it down to the gravel. The concrete extended 5 feet under the walls of the shaft itself. The construction of this block of concrete under a shaft 156 feet high and weighing 36,000 tons was a delicate operation accomplished in this way:—On the east and west sides, near corners diagonally opposite, cuts or trenches 4 feet wide and $13\frac{1}{2}$ feet deep were made from the outer lines of the foundation and extended by tunnelling 18 feet under the base of the old foundation. When completed they were filled with concrete, and other cuts opposite to them were made in like manner, carried under the old base and filled with concrete. The removal of so much bearing surface in these two tunnels under the old foundation was sufficient to cause motion in the structure, and after this but one cut was made at one time. The work was continued and completed by this system

of narrow cuts, which were filled with concrete until the entire sub-base was finished. After this 10 feet in thickness of the outer part of the old foundation was removed in sections 10 feet wide and replaced with concrete extending 10 feet out on the new base.

Being under the impression that when I saw the monument, at that time 156 feet high, as stated, it inclined somewhat out of the perpendicular, and as Mr. Hutton, in describing the underpinning and strengthening of the foundation, did not allude to the fact, I wrote him through the *Engineering Record*, and my letter and his answer appeared in a recent issue of the journal to the effect that it did incline slightly, but that its rectification was effected through the process of underpinning, though he does not say precisely how. I remember, however, that previously to strengthening the foundations in the manner described it had been proposed to excavate beneath the monument, introduce a series of upper and under sills of heavy timber with uprights or posts between them, introducing some hundreds of jackscrews, and letting down the monument gradually on one side to the level of the other. This process I applied myself in a modified form and on a smaller scale in bringing back to verticality a factory chimney some 80 feet in height at Hook's mills, in Grant Street, Quebec. After cutting away a wedge-shaped slice of the brickwork from beneath the shaft, or between it and its foundation, by means of jackscrews it was let down by so much, the thickness of the wedge sawed out bearing the same proportion to the breadth of base as did the inclination over to the height of shaft, which inclined some 2 feet from the perpendicular.

Gravel and sand are counted among the incompressible materials for foundations when prevented from spreading sideways. The resistance to lateral spreading is usually furnished by the adjacent sand, and when this is insufficient the surface rises as the building sinks, precisely as water does around a vessel in a lock, with the additional weight of an incoming cargo.

(To be concluded.)

THE Liverpool School Board has adopted a recommendation of the education committee, that the sites and buildings committee be instructed to look out forthwith and negotiate for a site in Kirkdale for the erection of a permanent free school to accommodate 1,200 children.

SANDWICH CORPORATION WATERWORKS.

TUESDAY, the 30th ult., was the day fixed for formally taking over the waterworks from the contractor, and at 2.30 the Mayor and Corporation assembled at the Guild Hall, where carriages were awaiting to convey them to Woodnesborough, where the pumping station is situated. The party consisted of the Mayor, Major Mate, aldermen, councillors, Mr. Courtney, C.E., representing the engineers, Mr. Brown, C.E., Mr. Dick Baker, town clerk, Mr. A. J. Catt, borough surveyor, who has acted as clerk of the works, and Mr. Sprague, manager for the contractor, &c. At the foot of Beacon Hill the carriages drew up in front of the substantial red brick buildings, one of which sheltered the boilers and machinery, the other being intended for the engineer. The party from Sandwich were greeted by those who had already arrived, including Mr. W. E. Long, chairman of the Easby Rural Sanitary Authority. After a few remarks the Mayor, under the direction of Mr. Courtney, started the engines. The party then proceeded to the reservoir, and the Mayor, after a few appropriate words, opened the valve which admitted the water to the main leading to the town, Mr. W. E. Long doing the same with the valve on the main leading to Ash. The party were then driven back to Sandwich, where the Mayor tested one of the hydrants in Market Street with entire success. At the invitation of the Mayor, the members of the Council and a few friends attended at the Guild Hall to drink success to the undertaking. Speeches were made by the Mayor, Councillor Jacobs, Mr. Courtney and others. The boilers, engines and pumps are in duplicate, the pumps being capable of delivering 15,000 gallons of water per hour to the reservoir on Beacon Hill. They have been supplied by Messrs. Warner & Son, of Walton-on-the-Naze. Mr. H. Roberts, of West Bromwich, was contractor for the works, which have been designed and superintended by Messrs. Easton, Anderson & Goolden, the engineers.

NEW premises of the Royal United Service Institution in Whitehall will be opened in February, and under a new regulation the public are to be admitted on five days in the week at a charge of 6d., one day being reserved for holders of tickets issued by members. Nearly the whole of the contents of the museum have been removed from the old building and rearranged in the banqueting-hall of the palace.

PORTLAND CEMENT.

THE following communication has been addressed by Messrs. Renshaw, Kekewich & Smith, the well-known solicitors of London, to all the cement manufacturers on the Thames and Medway, and a meeting of the manufacturers is shortly to be held in reference to the matter in question, which is of great importance to the trade:—

2 Suffolk Lane, London, E.C.:
October 26, 1894.

Sirs,—We are desired to call your attention to the following circumstances seriously affecting the trade in which you are engaged. It is becoming notorious that several manufacturers of English Portland cement are largely adulterating their manufacture by the mixture of Kentish rag stone, other stone, furnace or oven ashes, disused or exhausted firebricks or other inert material, and so bringing disrepute upon the good name English cement has hitherto borne in comparison for quality with cement of foreign manufacture. Such practices are so detrimental to the best interests of the cement trade, both by the discredit which is thereby attached to English manufactures and the unfair competition in prices thereby rendered possible, that it is now proposed to establish an association of English cement manufacturers for the purpose of dealing with and, if possible, putting a stop to a practice so unprincipled and disreputable, and so calculated to perpetuate an injury to the trade. We are instructed to inquire if you would be willing to join an association of cement manufacturers for this purpose, and if so we shall be glad to hear your views on the subject and to know if you would attend a meeting presently to be convened.—We are, gentlemen, your obedient servants,

RENSHAW, KEKEWICH & SMITH.

THE Corporation of Deal have agreed to purchase from the War Department for 35*l*. all that is left of Sandown Castle, erected by Henry VIII., with Deal and Walmer Castles for the purpose of defence. People are still living in Deal who can remember when there was a good stretch of land between the castle and the sea, but during the last half-century the sea has made great inroads upon this part of the coast, until the little that is left of the ruins is submerged at high water. The ruins are being acquired for sea defence purposes.

STREET TUNNELLING IN BIRMINGHAM.

THE new tunnel scheme of the London and North-Western and Midland Railway Companies has now invaded the principal streets of Birmingham to an extent, says the *Birmingham Post*, which enables the public to form some conception of the magnitude of the undertaking. The destructive portion of the work is practically completed, and a pretty big clearance has been made. Along a line extending side by side with the present railway for a distance of 622 yards—roughly, more than a third of a mile—a space about 22 yards in width has been taken in hand. Throughout this tract, which crosses New Bartholomew Street, Shut Lane, Moor Street, Nelson Passage, High Street (some distance above the Market Hall), and ends at the corner of Phillip Street and Worcester Street, the demolition of buildings has been going on apace, simultaneously with the more slowly-progressing work of constructing the brick arch of the new tunnel. The buildings on the west side of Worcester Street, erected on immense girders over the bell-mouth made to the old tunnel when the new part of the station was constructed, will not be interfered with. On the opposite side, however, near the corner of the Market Hall, two large shops in Worcester Street and four adjoining shops in Phillip Street have been pulled down, while the premises in the rear of some other buildings in Phillip Street have been affected to a greater or less extent, the line of the projected new railway and that of Phillip Street diverging, so that at the High Street end the opening for the former is two frontages higher than the street corner. In High Street, on the right-hand side going down, four large and well-known business establishments have come down, though their occupants have found accommodation not far away. On the opposite side, three large shops and a portion of the Lion and Lamb public-house have been sacrificed, while Nelson Passage, which opens into High Street a little further down, and used to lead deviously to Moor Street, has been cut across by the excavation, and is, for the present at any rate, a *cul de sac*. The besom of destruction has swept right across into Moor Street, at a point some distance below Castle Street, carrying away on the east side, between Scotland Passage and Nelson Passage, an important frontage of which the old Wesleyan Assurance Offices formed part, and on the west side a number of old offices, shops and back houses. The new line will tunnel side by side with the old under Shut Lane and the Great Western Railway, but from this point to St. Bartholomew Street the destructive work has been comparatively

ROOFING FELT.

Selly Park

unimportant. In the purchase of properties, in compensation to owners and tenants, in pulling down buildings, and in propping and underpinning others an expense of something like 80,000*l.* has been incurred. The gaps in the principal streets, of course, will be filled up with new buildings, built where necessary on huge girders, and nearly the whole of the line will be covered and the ground again utilised for buildings, so that the preliminary outlay will not be altogether a dead loss.

If the whole length of this section were cleared and excavated before any constructive work was begun, we should have a fosse some 20 feet or 30 feet wide and a third of a mile long extending through one of the busiest parts of the city. At the corner of Worcester Street the depth would be more than 30 feet and the width would be increased by the short open portion of the old line near Swan Passage. Under or across High Street the excavation would run to a depth of about 35 feet from the surface of the roadway, while the lower part of Moor Street would be cut through to a depth of 25 feet or more, and the Great Western Railway, which goes under the street at a much higher point, would be tunnelled under at a depth of 20 feet or more. These depths are roughly those which have to be reached in order to lay the roadway of the new line. They would not be permanent and, as we have already hinted, the picture of this gigantic trench has only been suggested in order to give some idea of the immense amount of purely preliminary work. The section when constructed will consist of a double set of rails running through a tunnel 10 feet to the south of the present line. The rails at Worcester Street will be 27 feet below the street surface, at High Street $31\frac{1}{2}$ feet down, and at Moor Street $22\frac{1}{2}$ feet down, and will pass under the Great Western line $19\frac{1}{4}$ feet below the metals of the latter. From the station there will be a short decline of 1 in 96, increasing to one of 1 in 53 from Worcester Street to Shut Lane. From Shut Lane to Park Street the decline will be 1 in 60, after which, the new line passing under the Recreation Ground and rising 1 in 50, will emerge with its companion line into daylight at New Bartholomew Street and pass over New Canal Street and Fazeley Street by an extension of the old viaduct. From this point the extension is carried out on the north side of the old line, and that section of the work begins which has for its object the substitution of viaducts for the level-crossings of one railway over another, which hitherto have so complicated and hindered the North-Western and Midland traffic in and out of Birmingham.

The constructive part of the work, as far as the town section is concerned, is going on at present only in the neighbourhood of Park Street and Moor Street. The operations on the east side of Moor Street are considerably advanced. The ground having been excavated to about 10 feet below the contemplated level of the rails, the digging has ceased in the centre, but has been carried down at the sides below the extreme depths already mentioned, in order to lay the foundations of the abutments of the tunnel. The brickwork, which is 3 feet in thickness, is carried on until the arch of the tunnel (which has a 26-feet span) is completed, all the masonry work being done in the daylight. The core of earth will then be extracted, and the bed of the permanent-way laid. A very good illustration of this mode of working is to be seen on the east side of Moor Street, where some twenty or thirty yards of the masonry of the tunnel may be seen complete, with other portions in various stages of construction. The site also affords a good example of the geological conditions. The soft sandstone, while giving little trouble to the excavator, forms an excellent foundation for the brickwork, and is not liable to slips at the side of the cutting. As soon as the brickwork is fairly set the earth is heaped over it, and in due time the site will be re-covered with buildings. This method of working, known to engineers as "cut and cover," will be used at every point except two. Even Moor Street itself has been dealt with practically on this plan, the roadway having been cut through one Sunday and replaced on baulks of timber, forming a temporary bridge, under which the tunnel works have been going on. It may be necessary to cut through High Street in the same way. The roadway there, however, is so much further above the tunnel that boring would be more practicable in this case than in that of Moor Street. At any rate, that portion of the work will not be taken in hand for some months to come, and no notice has been given to the municipal authorities of any intention to interfere with the street. The really important exception to the "cut and cover" method, however, is to be found where the line passes under the Great Western Railway. This will be a long and troublesome piece of work, as a suspension of the Great Western traffic is out of the question. A temporary bridge will be built under the Great Western line with baulks of timber a foot and a half square and 60 feet long. Then the excavations will be carried to the required depth, and a permanent bridge, consisting of massive iron girders resting on masonry abutments, will be constructed. At one point the new line, like the old, will remain open to the sky, namely, near Swan Passage, to the north of Phillip Street. As for the passage under Worcester

Street, that will give very little trouble, as the street at the point of crossing is partly over the widened mouth of the old tunnel. The roadway is already more or less honeycombed with vaulting, and the buildings just taken down rested on immense girders, as those on the station side still do. The completion of the section will provide a new double line of rails running through a separate tunnel into the new portion of the station. The still more extensive, if not so imposing, sections of the work in the open, beyond New Bartholomew Street, will give the Midland practically independent access to a station under their own control, for traffic purposes, in the centre of Birmingham. The prior rights and running powers of the London and North-Western Company, however, are jealously reserved, and the whole of the works are being done in that company's name, under an Act of Parliament obtained by them and under the direction of their engineers, though the cost—which, including the various sections outside and some alterations in the station itself, will mount up to something over a quarter of a million—will be apportioned between the two companies. When the work is done, which will not be for eighteen months, there will be an end to the anomalous state of things under which a station containing six main platforms and fourteen sets of metals, and having a traffic of over three hundred trains a day, of which about a hundred and twenty use the new part of the station, has been served on its busiest side by a tunnel with only two lines of rails.

OLD AND NEW BUILDINGS IN EDINBURGH.

In a moment of regrettable dyspepsia Carlyle called our time an age of unbelief. In spite of his internal trouble, we still are holding firmly to our faith in things that are ancient—old pipes, old books, old friends (and in that number Horace), and old houses. In the last instance there has almost grown up a legend of a golden age. "You won't find work like that nowadays" is the remark made to workmen who come to patch up mansions built in the time of powder and patches. And the workman discreetly holds his tongue. Society is founded on fictions; the belief that our ancestors built well and firmly and with their eye cocked on perpetuity is a myth. Builders who are conversant with the secrets of our older streets and squares could tell a tale if they cared to speak. With no desire, in these dyspeptic days, to take an optimistic view of the present generation, we wish to say that the average quality of work in the building trade is far above that with which our grandfathers were contented, and that it is rising rapidly. In making odious comparisons between the new and the old, we have to remember that in the affairs of architecture the bad perishes, while the good remains. The workmanship in the houses of modern construction is superior to that of a former time, but through no fault of ours the material is worse. Virgin forests have been cut up, quarries are exhausted; nature is to blame. Our national income has been going up by leaps and bounds, and it is idle to suppose that no part of it has been diverted into building with increased care. Before we conclude we shall also find that Mr. Henry George's apothegm about the poor growing poorer dissolves itself into thin air.

Part of the superiority of the modern house has been due to our increase of knowledge. In those pseudo-classical mansions that cover the north side of our city with windy squares and crescents, most of the internal partitions are formed of lath and plaster, sounding hollow to the thump. Our ancestors were forced to build in this way, because the use of the iron beam was as yet unknown, and they were either compelled to carry their brick partitions from the bottom to the top, or use those of less durability. In a West End mansion it is clearly impossible to form the rooms on each flat like those below it, and brick was used as scantily as might be. In spite of the comic artist and his impossible sketches of the suburban villa, the lath and plaster partition has almost disappeared; it can scarcely be found even in the cheapest tenement; it is in danger of becoming a lost art, if to such a simple process we can apply so high a term. While we are thus referring indirectly to old carpenter-work, let us say that the deceased gentlemen who did it were not a bit better than they should have been. In constructing the framework to form a ceiling, the much-abused, long-suffering carpenter of these times uses wood of a definite size, $3\frac{1}{4}$ inches thick by $1\frac{1}{2}$ inch, and fastens these pieces to his joisting every three feet. His grandfather of pious memory was content to put the refuse of his wood-yard into this work, and seldom fixed his material any oftener than once in 7 or 8 feet. The consequences of this carpenterial sin are that his work is bent and twisted. Moray Place, Charlotte Square, well-to-do crescent and terrace—their ceilings hang suspended above the dinner-table by a few tacks; we have a vision of their coming down and burying up the old ladies and the poodle dogs that people Melville Street, along with their light wines and sacred silver *épergnes*. During some alterations in Royal Terrace some workmen were ordered to remove a ceiling in the upper part of the house. The men clambered between the framework and the roof, and proceeded

to strike down lath and plaster. No sooner, however, did they perceive what they were standing on than they rushed to the ladder. The carpenter-work carrying the whole was fashioned out of waste sap-wood cuttings from the edge of a log, and consequently decayed before it was put in. Yet this was the only road out to the roof, and for nearly a century the chimney-sweep had been walking over supports he could have snapped on his knee.

Not to make the internal economy of these houses as bare as Hippias Fernald laid his digestive apparatus, we may say that their carpentry is decidedly inferior to that of our time. It is true that the material, in the main, is excellent; faultless lengths of American pine that would, in these poorer days, be wrought up into doors and finishings, are buried deep in walls under coats of plaster, and the beams of Memel seem, like the Psalmist's doors, to endure for aye. But for that neither the master nor the workmen can be praised. Since then forests have been exhausted and even the Memel pine is now scarce and of inferior quality. Nevertheless, while the wood is excellent there is a general tendency to be far more sparing with it than would at present be thought safe. This disposition comes out in a thousand ways; but it will be sufficient illustration of an unlaudable economy if we say that the older builders frequently used for joisting battens 7 inches by 2½ inches, where we should now lay down deals of much greater strength, 9 inches by 3 inches.

To examine each of the trades connected with building by itself would entail a work as endless as the "Rime of Sir Tophas" and one as profitable. It will, however, scarcely be necessary to convince even the most ardent admirer of "rusty airs" and "auld world gear" as to the superiority of our sanitary arrangements. When Edinburgh made its extraordinary excursion across the Nor' Loch our ancestors had not got far beyond the "Gardez l'eau" stage, and there is even a horrible legend of some belated plumber, lately present in the flesh, who stood up in the steamer as she sailed out of Dublin Bay, and pathetically addressed that land of "gentlemen," "Farewell to ould Ireland," he said with emotion, "farewell; I'm lavin' ye widout a plumber"—a clear injustice to the island.

In the other trades there has been both loss and gain during the course of the century. The haste with which our contracts are pushed forward in these unquiet times does not always leave the plasterer time to let his lime mellow for a month or two after being mixed. But there are compensations. We have finer and firmer cements than our fathers could even have dreamed of, and the use of the narrow split lath, which only began to appear in Edinburgh when the greater part of our imposing streets and squares had been built, is a most important improvement in the work of those that handle the float and the trowel. The modern mason has given up the use of the old Craigleith stone, hard, close-grained, flecked with basalt, presenting a firm clear edge after the frost and storms of centuries, for softer material. When honestly used, however, the mortar-mill has been a great advantage, compensating us for a little of this loss. From a mixture of engine-ashes and sandstone and lime in proper proportions a cement can be made which in a few years hardens into something worse to cut than even the stones it binds together.

These trifling notes are not without an interest for the student of history. It will be seen at a glance that those trades which are not adapted for an extensive use of machinery have scarcely improved their work, or improved it only a little. In those into which machine labour has been imported enormous strides have taken place, and the advance has been in proportion to the use of mechanical helps. Some one with a pretty taste for figures and facts has calculated that about eighty or ninety per cent. of the work done in woodworking occupations is performed by the steam-engine. So far as the building trades are concerned this is certainly an over-statement, but with the hundred ingenious appliances that mould and cut and saw, that whirl and hum and dab in a workshop of the modern kind, the use has been great. The change that has followed has been more than wonderful. The old deal door has vanished from the workman's house, and its place has been taken by one with panels and mouldings. To fit up a house with moulded architraves and neat panelled work now costs so little extra that contractors put into their cheapest tenements luxuries that fifty years ago would only have been seen in a place of superior construction. Aladdin's wonderful lamp has been rubbed in a wood-yard. The change is significant of a democratic time; machinery has begun the process of levelling up.

The wealth of the country has multiplied itself ten times since Edinburgh took its first step across the Nor' Loch. It is idle to think that the building or any other trade could have remained stationary in the midst of this multiplication and remultiplication; but, as we have shown, this gain has largely been one in the condition of our poor. The increase of wealth has been due to machinery and improvements that come in its train, and in strict equity every moiety of this advance should

have gone to those who have earned it by seeking out labour-saving machines. But wealth, like water, tends to spread itself over a wide area. It has been calculated that labour, whose hand in these days is bared to strike, earns in its own right some 7% or 10% annually, a sum on which the men who built the streets and squares of Edinburgh a hundred years ago must have lived. As the average pay of the working-classes is now 54%, the steam-engine has enriched them with some 47% to which they have no moral claim.

The improvements that have taken place in the condition of the builder are, however, not all of this material kind. Strange as it may seem to one who only hears the sharp sound of saw and plane, the most laborious of all trades was the joiner's. The men were prematurely bent and aged by the heavy labour of "flogging," flooring and running lengths of deep moulding. All this is now done, and done better, by the aid of machinery. What is taking place in the one trade is, to a smaller degree, going on in them all, and in estimating the gain and loss of a century the fact should tell heavily against the fundamental contention of Socialism, that the condition of the worker grows more irksome. It is difficult to realise the extent of the improvement, but one incident may be noticed. At a period within an easy compass of the memory, workmen in the suburbs, who of course had to bring their meals with them, had either to heat up their own breakfast during the meal hour or take it cold. When nine o'clock struck the men might be seen climbing over fences in all directions to ask the servant maids to put their pitchers of coffee on the fire for a minute or two. All that has been changed, and an employer is now bound by one of the unwritten laws of the trade to provide some one to warm the flasks before meal time. It may be thought that this concession was wrung unwillingly from the masters by the powerful trade guilds. Nothing could be further from the truth. Adam Smith's principle of "higgling in the market" must have the credit. Builders found it difficult to induce men to work on the outskirts of the city, and offered this convenience as an inducement. Others in the centre of the town had to follow suit, and the concession has passed into one of the unwritten laws of the building trade. In spite of the gains which a century has brought them, workmen are as ready as ever to pipe their eye and say that things are not what they were in their young days. It is an old feature in our nature, not unrecognisable even in the "blind old man of Chios." In the same way the pessimism of age induces those who ought to know better to say that house-building is degenerating, and younger men conscious of the flaws in their own work are ready to join in a cry so deceptive to the public.

THE THIRLMERE ARBITRATION.

THE arbitration in the case of the Hon. James Lowther v. the Manchester Corporation was resumed before Mr. C. Oakley on the 1st inst. The claim on the part of Mr. Lowther, who is trustee for the Lonsdale estates, is for compensation in respect of an easement affected by the construction of the Thirlmere aqueduct through Grasmere Common, Spital Farm, Kendal and Hutton Roof Farm, Kirkby Lonsdale, and also in respect of stone got in the construction of the aqueduct through Westmorland on lands over which Lord Lonsdale is lord of the manor.

Mr. Balfour Browne, Q.C., for the Corporation, characterised the claim, says the *Manchester Guardian*, as being to a large extent unjustifiable in law and in fact. It was an attempt on the part of Lord Lonsdale and his advisers to blackmail the Corporation of Manchester, using "blackmail" in the sense in which the word had been used by Lord Salisbury in the House of Lords. Where no blackmail was attempted, an owner tried to get the value of the article taken from him; where blackmail was attempted, he desired to screw something out of another by reason of the latter's needs or necessities. The whole case was based on a series of fallacies both of fact and of law. The question of fact—the value of the article taken—would be established conclusively by the evidence. Of course they were accustomed in these cases to the exaggeration of figures. It was the usual trade of surveyors on one side or the other. But this was not a case of that sort. The whole claim was based on half a dozen fallacies, the most ridiculous ever put before an arbitrator. The arbitrator was asked to consider the question as one between a willing buyer and a willing seller, and also the value of the material, which in this case was stone, to the Corporation of Manchester; but he protested altogether against the introduction of the phrase willing buyer and willing seller. It was introduced with the view to get the arbitrator to look at what were the needs and necessities of Manchester in respect to its water supply, and to get him to put a value on the article from that point of view. This fallacy was finally exposed and decided in the Countess Ossalinski's case. It was equally a fallacy to look at this aque-

duct from the point of view of a wayleave. Wayleaves and willing buyers and sellers had nothing to do with the matter. It was the value of the material taken from Lord Lonsdale and the amount of the damage done to him that was the measure of what the arbitrator must give. The next fallacy was that the Corporation by going there had made a market for the stone—that they had used the stone for concrete. What did that matter? It must be shown apart from that that the stone had a value. But the claimant's advisers wanted to value the stone not at its value to him but to the Corporation. They admitted distinctly that they had not considered the damage done to Lord Lonsdale as the measure of the claim, and therein they were wrong. He was not suggesting that Lord Lonsdale should not receive payment for the stone taken; he only said that Lord Lonsdale should be paid the worth of the stone to him. The question was, what damage had been done to Lord Lonsdale, not what benefit had been done to the Corporation. That would upset the whole system of valuation. One might as well say that in assessing the value of a cottage taken for a railway the owner had a right to look at the traffic receipts of the line. The claimant had not the slightest right to consider what was the value or the benefit of the Thirlmere water to Manchester in estimating the damage. That would be "ransom" indeed. Any damage done must of course be paid for, and the damage done in this case was nothing, because there were countless millions of tons of this stone in the bowels of the earth. The learned counsel dwelt at length on the judgment of the Courts in the case of the Countess Ossalinski, wherein it was laid down that arbitrators were not to value land with reference to the particular purposes for which the land was required, particularly where the matter was under Parliamentary powers. This claim, he said, was founded not on the real value of the article to the claimant, not on what the thing would fetch in the market—for there was no market at all for the stone—but on its value to the Corporation, who for their own necessities had to get a certain quantity of it.

Sir J. Harwood, chairman of the waterworks committee, said the claim was of such an iniquitous character that if it was allowed all public works would be stopped. It would constitute the strongest case for the nationalisation of the land and of minerals he had ever heard. The whole industry of the country

would be paralysed if lords of the manor were allowed to slip in charges of this kind. In his opinion the stone had no value in this case. Apart from Manchester's use of the stone, there would have been no market for the article for hundreds and perhaps thousands of years to come. If the stone had been his property he would never have dreamed of asking anything for it. He considered the Corporation had rather improved Lord Lonsdale's property than otherwise. At the same time, although there was nothing for which to pay, because nothing of value had been taken, he recognised the fact that Lord Lonsdale was lord of the manor and would, as a matter of sentiment, offer some small recognition—sufficient to acknowledge the right.

In cross-examination, Sir J. Harwood said that even had the tunnel not gone through stone the cost of the work would not have been materially different, because there was an abundance of stone in the neighbourhood to be obtained at an almost nominal cost. You really seriously believe that if there had been no stone throughout the whole eighteen miles of Lord Lonsdale's property and stone had had to be obtained elsewhere such stone could be had for nothing?—It could be got almost anywhere. Are you an advocate of betterment?—I think so. Then if everybody had his rights Lord Lonsdale would rather pay you than be paid by you?—If betterment were in operation he would have to pay. I suppose you accept the statement that the stone is worth nothing and that therefore nothing ought to be paid for it?—I do. According to your view, no damage has been sustained?—None. Then why do you propose to pay Lord Lonsdale anything?—He is in the position of a man who has got a stable but has no horse. Lord Lonsdale had stone, which, according to you, he could not sell. Ultimately somebody comes and wants that stone. Ought not that somebody to pay for what he wants?—We are willing to pay for the wayleave in the same way we have paid everybody else. As far as you know, the tunnel through the manorial property has done no damage?—That is my view. You also say that the stone is worth nothing; then why do you propose to pay him anything?—Very little.

Answering further questions, Sir J. Harwood said this claim, if allowed, would not add materially to the cost of the Thirlmere scheme. The Corporation were resisting the prin-

ciple, not the amount. He did not say the stone got from the aqueduct was worthless to the contractor for concrete. It was, however, worthless to Lord Lonsdale. This was the last claim the Corporation had to deal with.

Mr. J. Bell, county surveyor, Carlisle, gave evidence to the effect that the stone got from Lord Lonsdale's property had no commercial value.

On the resumption of the arbitration for compensation for easement, evidence was given by Mr. Beattie, builder and contractor, Carlisle, Mr. T. Dirkin, contractor, Kendal, and Mr. T. Newton, builder and contractor, Ambleside, to the effect that the stone which was got in the construction of the Thirlmere aqueduct through Dunmail Raise, and which was used to make concrete, had no commercial value whatever. It simply abounded in the neighbourhood, which, as one witness said, was made of it, and people would be glad to have it carted away, so that they might grow grass instead of growing stone. These witnesses also testified that in their experience, which was extensive, they have never known a lord of the manor claim for the stone got in this way and used for concrete.

Mr. J. Hodgson, builder, Grasmere, stated that on what was known as Grasmere Common and on the line of the aqueduct there were many quarries, and the custom had been for anyone who wanted stone to go and get it. He had been in business himself for thirty-eight years, and he believed the custom was hundreds of years old. He had never paid anything to the lord of the manor either as royalty or quarry rent for this stone, and the representatives of the lord of the manor had never attempted to exercise any control over him or anybody else. Payment was always demanded for slate, however. The witness handed in a long list of buildings which he had erected from stone got from the Common, chiefly helm crag. During the construction of the Thirlmere aqueduct he frequently visited the work in this locality, and saw that the stone got was of no use whatever for building purposes.

Counsel for Lord Lonsdale (Mr. Page) asked witness whether he was aware that the practice of taking away and selling this stone was absolutely unknown to Lord Lonsdale.

The witness replied that he was not.

Mr. Page observed that they were obtaining some useful

information. It would appear that everybody had been allowed from all time to carve away at these rocks. It was a wonder there was any left.

Sir B. Baker, vice-president of the Institution of Civil Engineers, referred to the contention on behalf of Lord Lonsdale that a commercial value was given to the subsoil by the fact of the Corporation having to pass through it. If that principle were adopted in valuations for railways the result would be absolute chaos. In making a railway every yard of the stuff excavated would be used, and therefore a "commercial" value was given to the stuff, but in estimating that value they must consider whether under ordinary circumstances the stuff would have been likely to be wrought, the period over which its excavation would be extended and the evidence as to its value. If that were worked out the value would be found to be so infinitesimal as not to be worth talking about. It was a fallacy to hold that the Corporation gave a commercial value to the material.

If you were asked to estimate the value of this stone, would you have regard to the particular quantity used by the Corporation?—I should ask at what period the rock would probably have been quarried had I not gone there, and what the rock would be worth when quarried. In your view, has this stone in the hands of Lord Lonsdale any commercial value whatever?—Practically speaking none.

By Mr. Page: Is it not the fact that in thousands of instances mineral wayleaves for only short distances underground pay so much per ton for the mineral taken?—Very likely, because they follow the analogy of overground wayleaves. Assuming that to be the practice in a certain district, I suppose you would allow that that wayleave has a market value?—Yes, as you put it.

Answering further questions, the witness said he would allow a certain sum for any severance of Lord Lonsdale's property. He agreed that in case a railway company in making a cutting found stone for bridge-building, the fact would have to be taken into consideration, but he would consider also in estimating the value whether the stone would have been wrought had the railway company not gone there, and also its plenteousness or scarcity in the neighbourhood.

Mr. J. Smith, valuer, Bradford, estimated the total damage

done to Lord Lonsdale's interest on Grasmere Common, Spital Farm and Hutton Roof Farm at about 1,300*l.*, including 200*l.* as a nominal recognition of his rights as lord of the manor. He allowed nothing for stone taken out of the aqueduct.

Mr. Page: That is to say, you take away some 150,000 cubic yards of a man's property and allow nothing for it?

The witness replied that the stone was valueless.

Mr. J. Mansergh, civil engineer, agreed with previous witnesses for the Corporation that the stone excavated in making the tunnel had no marketable value, and that the fact that the Corporation used the stone for concrete was no ground for the present claim. If public bodies were to be burdened with such outrageous payments for a purely fanciful injury, a great impediment would be placed in the way of their schemes, and no engineer would be able to make trustworthy estimates of the cost of the undertakings. The introduction of the aqueduct created a theoretical rather than a tangible injury to the estate. He would allow 200*l.* as an acknowledgment of the manorial rights, and in respect of the works through Grasmere Common, Spital Farm and Hutton Roof he allowed rather less than 1,000*l.* If apart from the needs of the Corporation the owner could show that the stone had a practical value he should be compensated for it.

Mr. A. Hogarth, surveyor, Kendal, considered that 1,221*l.* would satisfy the whole of the claim.

Mr. G. Hill, the engineer of the Corporation, stated that the stone cost 30*s* a cubic yard in some places to excavate, and that therefore the presence of the stone, estimated by Lord Lonsdale's witnesses to be worth 1*s*. a yard, was a real drawback. Asked by Lord Lonsdale's counsel whether he had ever known a case in which a quarter of a million tons of material had been taken from a man without its being paid for, Mr. Hill replied that this stone had no value to Lord Lonsdale and that the claim was unprecedented.

Mr. Balfour Browne, Q.C., addressed the arbitrator at considerable length for the Corporation, arguing that until the Corporation went to Thirlmere and created a market for the stone the stone had no value, and would not have for perhaps thousands of years to come. The claim in respect of the stone was therefore an attempt to blackmail the Corporation. He pointed out that over "customary" lands the lord of the manor had no right to touch the minerals without the consent of the surface-owner, and that as to enfranchised lands, which constituted another large portion of the land in question, there was no evidence that the mineral rights were reserved to the lord.

Mr. Page, on behalf of Lord Lonsdale, replied in detail, and referring to Sir John Harwood's evidence as to the dangerous principles involved in the claim—as to the ability displayed in which evidence he paid a tribute—he characterised Sir John's fears as merely noble sentiments. It was undeniable that had not the Corporation had the advantage of the stone they must have procured the stone elsewhere, and have paid very well for it. It did not matter that the labour of the Corporation brought out the stone. He asked for no blackmail, but for the fair market value of that which Lord Lonsdale had lost and the Corporation had acquired. This was no new principle.

The arbitrator will present his award in due course.

PATENTS.

This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

HEATING AND VENTILATING APPARATUS. GRUNDY'S SPECIALTY. PURE WARM AIR.

UPWARDS OF ONE THOUSAND TESTIMONIALS RECEIVED.

PURE WARM AIR AS SUPPLIED TO

Truro Cathedral; Londonderry Cathedral; Sherborne Abbey; Kilmore Cathedral; Stanley Cathedral, Falkland Island; Cardiff Catholic Cathedral; the Queen's School Chapel, Eton; Cork Asylum; Leicester Asylum; and to upwards three thousand Places of Worship; and a great number of Mansions, Houses, Hotels, Hospitals, Schools, Warehouses, Factories, Workhouses; Cork Law Courts, &c., &c.

84 Brook Street, Grosvenor Square, W.: December 8, 1893.

Sir WILLIAM BROADBENT encloses cheque for the "GRUNDY" HEATING APPARATUS supplied to his house, and is glad to say that it has proved very satisfactory for warming and ventilating as required. The principle of the apparatus is most excellent.

To Mr. Grundy.

PROFESSOR TYNDALL writes:—

October 24, 1893: Hind Head House, Haslemere.

Dear Sir,—My house being so well provided with grates and flues for the generation and distribution of pure warm air, I have been enabled to spend my winters in England instead of on a foreign shore.—Yours very truly,

JOHN TYNDALL.

Fever Hospital and House of Recovery, Cork Street, Dublin: October 26, 1894.

Dear Sir,—I have much pleasure in informing you that we have found your HEATING APPARATUS a great success in our new Epidemic Hospital, which consists of a two-story building, each story containing two large wards, a smaller isolation ward, and two nurses' rooms. It is easily managed, does not cost much for fuel, and the air entering is most pleasant, warm, and free from smell. It is with the full concurrence of the Managing Committee I give you this testimonial.

Yours faithfully, JOHN MARSHALL DAY, Registrar and Resident Medical Officer.

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TRADE NOTES.

THE Rowley School Board have accepted the tender of Messrs. Cockin & Sons, of Blackheath, Rowley, for the works of alteration at Cradley Heath Infants' School, at a cost of 1,218*l*.

A NEW eight-day illuminated turret-clock has just been erected at the Grand Hotel, Ashington, by Messrs. W. Potts & Sons, of Leeds and Newcastle-on-Tyne, from instructions received from Mr. Benjamin Simpson, architect, Grey Street, Newcastle. Messrs. Potts have also in hand a new Cambridge quarter-clock with four external dials for St. Cuthbert's Church, Crook, West Durham.

THE Climax direct-acting turret ventilator Company's design having been selected by the architect, Mr. George Simpson, for the ventilation of the Leith Infectious Diseases Hospital, now in course of erection, Messrs. Cousland & Mackay, ventilating engineers, of London and Glasgow, who are the manufacturers of these ventilators, are now supplying a large number for this purpose.

THE Pershore Rural Sanitary Authority have accepted the tender of Mr. H. Lane, of Wolverhampton, for works of water-supply at Wyre and Bishampton at a cost of 730*l*.

At a recent meeting of the Glasgow Police Board, the inspector of lighting submitted a report on the ten incandescent lamps which were fitted up in St. Vincent Street, between Buchanan Street and Renfield Street. The report stated that the first was put up on May 8 last, and the others in the beginning of July. Five of the lamps consumed 5 cubic feet per hour, and five 3½ cubic feet. It was found that the mantles on the 5-foot burners were not so durable as the others, and the burners were changed, so that all the lamps are now consuming 3½ cubic feet per hour, the annual cost for ten lamps being 17*l*. 3*s*. 3*d*. The cost for gas before the burners were changed was 39*l*. 13*s*. 10*d*.; difference in cost per gas, 27*l*. 10*s*. 7*d*.; the cost for the burners is 11*l*. 5*s*.; difference on the first year, 11*l*. 5*s*. 7*d*. In addition there is the cost of renewing defective mantles. During the course of this experiment four required to be replaced at a cost of 6*s*. 4*d*. So far as the light is concerned, it may be taken that the gas consumed in the incandescent lamp yields four times the quantity that the ordinary flat-flamed burner does. The committee directed the inspector to extend into Gordon Street and into George Street eastwards to High Street the experiment of lighting these streets by means of incandescent lamps. Bailie Primrose, in moving the adoption of the minutes, said the committee had every confidence that incandescent gas-lighting would play an important part in the future lighting of the city. The minutes were approved.

THE new schools for the Barrow-in-Furness School Board are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

WE have received from Mr. John Spencer, Globe Tube Works, Wednesbury, a very convenient aluminium scale which he has just brought out for gauging the sizes and weights of his tubes, and which is graduated for metres and for inches. It is a handy little article for carrying in the waistcoat pocket.

A NEW style of envelope has just been brought out by Beechings Limited, of 174 Strand and 45 Upper Baker Street. It has been specially designed for use with any form of type-writer, and it affords the best possible surface for type-writing the address, "shadowing" being avoided and the writing correctly aligned.

THE Swindon Local Board have decided to apply for a provisional order for electric lighting of the town.

BUILDING AND BUILDERS.

THE Birmingham City Council have adopted the recommendation of the markets and fairs committee to have the altered plans for the new meat market and slaughterhouses carried out at an additional cost of 5,000/.

THE Mersey Docks Board at their last meeting approved plans for the erection of new lairages at Seacombe to deal with the foreign cattle trade. The estimated cost is 400,000/.

THE Chester-le-Street Board of Guardians have instructed Mr. Cowe to prepare plans for the erection of a new infirmary on the workhouse grounds and for a new board-room and offices.

PLANS by Mr. Meredith, architect, for new Board schools at Tump Road, Blackheath, Rowley, have been approved by the Rowley School Board.

ELECTRICAL.

THE electric-lighting works established at Crowlands by the Southport Corporation have been opened, the cost having been 13,000/. The installation is equal to 6,200 8 candle-power lamps, and applications have been already sent in for 4,700 lamps. An alternating current will reach the lighting area at a pressure of 2,000 volts, and there will be six transformer substations for the convenience of the public buildings, shops and houses which take the supply.

IT is proposed to introduce the electric light into Paisley. The provisional order obtained by the Council is apparently to be transferred to a Caledonian Company.

AT Milngavie, N.B., the electric light has been inaugurated. The power is obtained from a turbine wheel which is driven by water from the river Allander.

VARIETIES.

THE Barnsley Town Council propose to apply to Parliament for power to extend their water supply, a scheme of which has been prepared by Mr. Charles Hawksley, engineer. The borough surveyor, Mr. J. H. Taylor, has prepared a report on the scheme, in which he estimates the cost as follows:—Cost of works, 146,000/.; Parliamentary expenses, 10,000/.; interest on outlay during construction of works, 10,590/.; extras

3,050/.—170,000/. The site is the same as that once chosen by Wakefield, whose attempt was defeated by Sheffield opposition, and it is expected that there will be great opposition in this case also.

IT is intended to construct a pier about 700 yards in length at Ardeer, near Stevenston, on the Ayrshire coast, from designs by Messrs. Crouch & Hogg, C.E., Glasgow. It will be a private pier solely for the convenience of Nobel's Explosives Company and will be carried out into the sea a long way below low-water mark, so that their fleet of steamers may load at all states of the tide.

IT is proposed to retain the convicts at Dover. The Board of Trade have been losing the foreshore between Dover and St. Margaret's Bay owing to the encroachment of the sea, and the lighthouses and other buildings on the cliff are likely to become endangered. It is proposed to let the cliffs be escarped by the convicts and that the town find paid labour to reclaim about 300 feet of land under the whole three miles of cliff.

ARTISANS' DWELLINGS IN MARYLEBONE.

By the conditions of their Act for the extension to London, the Manchester, Sheffield and Lincolnshire Railway Company are under statutory obligation to provide for the 2,910 workpeople who will be displaced. It is proposed to erect six blocks of artisans' dwellings in the neighbourhood of Cunningham Place and St. John's Wood Road, each block having six floors, and the whole accommodating 3,200 persons. The Marylebone vestry, having regard to the amenities of the locality, to the comfort of the working-classes themselves, and to the fact that other similar house accommodation will be provided hard by, suggest that five floors for each block would be ample and desirable. By the new Building Act, which will come into operation on Jan. 1 next, this will be the maximum height allowed. At the last vestry meeting a hope was expressed that means might be found for preventing the railway company from anticipating this Act by a few weeks and building workmen's dwellings of an elevation which on hygienic grounds was now disapproved. The works committee were instructed to seek a conference with the Building Acts committee of the London County Council with a view if possible of preventing the erection of the blocks as planned. It was intimated that the scheme for rehousing the people displaced would ultimately have to be sanctioned by the Home Secretary.

THE "OTIS" ELEVATORS.

THE "Otis" Elevator Co. write as follows :—It may be of interest to your readers to know that the large hotel now nearing completion on the Salisbury Estate, Strand, will be supplied with eleven "Otis" hydraulic elevators, seven of which will be for passenger use. This hotel will therefore have a better elevator equipment than any other hotel building in Great Britain or Europe. Among other contracts recently taken by this company for hydraulic elevators is one for the large business premises of Messrs. Charles Jenner & Co., Princes Street, Edinburgh, where we are erecting six hydraulic elevators ; 9 St. Mildred's Court, E.C., one hydraulic elevator ; Lord Vernon's mansion, Sudbury Hall, Derby, one hydraulic passenger elevator.

We are now erecting in St. Petersburg two hydraulic passenger and one electric passenger elevator ; in Moscow, one hydraulic passenger elevator, and have just shipped two elevators, with pumping plant, &c., complete, to the Nippon Yusen Kaisha Building, Tokio, Japan. The following are some of the many cases where electric passenger elevators are now being erected :—Gordon Mansions, Middle Class Dwellings Company, Limited, London, 2 ; Madame de Monbel, 132 Avenue Wagram, Paris, 1 ; Madame de Monbel, 24 Rue Ampere, Paris, 1 ; M. Pichot, 54 Rue de Clichy, Paris, 1 ; Hôtel de Calais, Paris, 1 ; Baroness Zuylen, Paris, 1 ; M. Schultz, Spandaterstrasse 16-17, Berlin, 1 ; Mr. H. von Derwis, St. Petersburg, 1 ; Graham Brothers, Stockholm, 1.

A MEETING has been held of the Aberdeen Harbour Commissioners, at which it was resolved that in view of the diverse opinions expressed by Mr. Wake, C.E., and Mr. Cunningham, Dundee, as to the pontoon bridge and its suitability for the harbour, and looking to the great economy in the adoption of such a bridge as against a swing one, the Board remit the matter back to the works committee to get the opinion of a qualified engineer on the whole subject and report to the Board. Lord Provost Stewart advised that before the Board resolved to spend the 45,000*l.* which the minutes authorised, they should take a little longer time to consider the position, because they were planning the docks for the next generation.

TESTING AIR IN AMERICAN SCHOOLS.

ACCORDING to the *Boston Journal of Commerce* great care is taken by the Massachusetts State inspectors of public buildings when testing the means of ventilation in a school house to secure all the data for an accurate and intelligent report. The barometric pressure, temperature and relative humidity of the outside air are first taken, together with the force and direction of the wind. The location of the building as to points of the compass, the position and direction of the fresh-air ducts and position of the inlets and outlets in the rooms are also noted. Upon entering the room to be examined thermometers are placed in various positions, on the inlets and outlets, at the teacher's desk, at the breathing line and floor among the pupils and near the outer door.

Careful measurements are then made of the volume of air supplied to and removed from the room by the ventilating apparatus. These measurements are made by taking the velocity in feet per minute of the air at the inlet or outlet by a standard anemometer and then multiplying this velocity by the average working area of the opening in square feet. For example :—The inlets and outlets are usually covered by wire gratings or by ordinary register facings, which obstruct to some extent the flow of air, and it is seldom the case that the air is found to be flowing alike through all parts of the opening. Proper corrections being made for these variations and for the running of the anemometer, a very close approximation to the actual volume of air passing through may be obtained. After keeping the doors and windows of the room closed for one hour, a test is made to ascertain the amount of carbonic acid in the air, the amount of this gas present being considered as a fair index of the other and more dangerous impurities in the air of the schoolroom. This test, unless great accuracy is desired, is usually made with an instrument invented by Professor Wolpert and called, from him, a Wolpert air-tester. This instrument is very simple, consisting only of a glass test-tube, on the bottom of which is a black mark, an inner tube of glass and a rubber bulb, all of a specified size, and a stand in which to hold the tube. The test-tube is filled to a certain height—marked on the tube—with lime water, and by means of the inner tube and bulb air from the room is passed through the water until, by the formation in it of carbonate of lime, the water is rendered so opaque that the black mark or spot cannot be seen. A table, furnished by the inventor, shows by the

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of 3½ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows :—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.
ARGAND " 44 " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.
WELSBACH " 10 " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

FOR FURTHER PARTICULARS, APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.,
14 Palmer Street, Westminster, London.

number of times the bulb has been filled how many parts of carbonic there are in 10,000 parts of air.

There are various sources of error, both in the measurement of the volume of air and determining the amount of carbonic acid, which have to be carefully guarded against by the inspector. This has been so well done in testing the air that in a large number of tests made with a Wolpert tester at the same time that samples of air were taken for chemical analysis, the average difference between the amount given by analysis and by the Wolpert test was only 67-100ths of one part in 10,000.

Tests to show the circulation of the air through the room are also made, usually by means of gunpowder smoke.

The report of the inspector, when complete, gives, in addition to the outside conditions already noted, the volume and temperature of air supplied and removed, the temperature of the room, the relative humidity of the air, the amount of carbonic acid found in it, and the results of the tests for circulation.

For determining the barometric pressure, relative humidity and temperature, and also for measuring the flow of air into and out of the room, the very best and most accurate instruments to be procured are furnished to the inspectors by the State.

These gentlemen by long practice and habits of close observation have become very expert in the use of the apparatus employed in testing air supplies to school houses and other buildings, and they are also equally expert in regard to methods and systems of heating and ventilation, their wide experience placing their knowledge and judgment in such matters far above those of men of limited experience in such matters, or mere theorists.

SEWAGE EFFLUENTS IN LANCASHIRE.

At the last meeting of the Mersey and Irwell joint committee Sir Henry Roscoe exhibited diagrams showing the results of the tests applied to sewage effluents in Lancashire. It was found that the county boroughs, with the exception of Rochdale, were in an unsatisfactory position. The population of the seven county boroughs was 1,148,699, and the sewage from 43 per cent. of this population flowed untreated into the rivers at the present time. Manchester was treating by chemical precipitation the sewage from a population of 269,865, but the effluent from the chemical treatment alone could not be con-

sidered satisfactory. Bolton, with a population of 115,000, was turning out a most unsatisfactory effluent, and Salford, with a population of 198,000, was in a similar position. Rochdale, on the other hand, with a population of 71,400, was treating its sewage efficiently. Bury, Oldham and Stockport had not yet sewage works in operation. Of the eleven non-county boroughs, representing a population of 294,277, Hyde, with a population of 30,670, was the only one in which a sewage treatment was at work, and this was a satisfactory result. With regard to fifty-six urban sanitary authorities, representing a population of 608,259, twenty-seven with a population of 261,134 had no sewage works in operation; twenty-two had sewage works, and, generally speaking, turned out satisfactory effluents from a population of 230,756, and seven had sewage works turning out unsatisfactory effluents from a population of 116,369. In other words, the sewage from 43 per cent. of the 608,259 population flowed untreated into the rivers; 38 per cent. was satisfactorily treated, and 19 per cent. unsatisfactorily treated. With reference to rural sanitary authorities, the results from twelve sewage works, with one exception, were fairly satisfactory. Whilst he had considered it his duty to point out to the committee the exact position at the present moment in regard to the sewage effluents, yet the proceedings of the committee showed that great progress was being made for the completion of sewage works, and that those authorities whose works were shown to be unsatisfactory were being compelled by the committee to take the necessary steps to insure satisfactory results.

INSTITUTION OF CIVIL ENGINEERS.

THE opening meeting of the session of this Institution was held on Tuesday evening in the hall in Great George Street, Westminster. Sir Robert Rawlinson, K.C.B., the president, in the course of his inaugural address dealing with the history and progress of civil engineering, said that of all the branches of civil engineering, no more remarkable progress had been made during the last half-century in any one department than in that which was concerned with the health and well-being of mankind. Sanitary science was in a sense as old as civilisation, but it might puzzle a lexicographer to give a satisfactory definition of it. Some learned professor might define physical science and force, but sanitary engineering he might reasonably say was not a science. Sanitary science did

HEWETSONS, Tottenham LONDON, W. Court Road, HOUSE FURNISHERS & DECORATORS.

Extract from THE GENTLEWOMAN (Mrs. PANTON).—"You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c. - DISMANTLING, CARPET-BEATING, &c.

HEWETSONS have always at hand a staff of steady and trustworthy men to send out to take up and relay carpets and entirely dismantle.

DECORATING.—HEWETSONS give ESTIMATES free of charge for PAINTING and all kinds of Interior Decorations, Structural Alterations, Sanitary Work, Electric Lighting, &c.

HUNTING AND SHOOTING BOXES completely furnished at three days' notice for £150, £300, &c., and delivered, carriage paid, to any railway station in Great Britain.

HEWETSONS' NEW ILLUSTRATED CATALOGUE is the best and most complete Furnishing Guide published, and is forwarded free of charge. It contains ESTIMATES for FURNISHING HOUSES for £150, £300, £500, £1,000, &c., each article in detail, illustrated and priced.

not necessarily meddle with medicine, nor with surgery, but based its results on scavenging, town sewerage, house draining, and on insisting upon all means for domestic and personal cleanliness.

Among the principal of the improvements brought about by the progress of sanitary science, after main sewerage, house draining, water supply and scavenging, had been the establishment of public baths, washhouses and disinfecting apparatus. Some of these establishments had, however, been too grand and costly, and also placed too remote from the poor, and had consequently been failures. Washhouses and baths for the poor should be situated in the heart of poor districts; their management should be economical, their charges the lowest, and the disinfection of bedding and clothing should be done gratuitously. Any bedding or clothing requiring to be burned should be replaced without charge to the poor afflicted sufferers, this being a charitable act and the truest economy for the ratepayers. Punish a family for having disease, and they would shrink from you; treat them kindly and sympathetically and the poor would respect you. It had become usual to credit sanitary works, such as sewerage, drainage and improved supplies of water, with the observed reduction of deaths in the district, and he was not inclined to repudiate this. But he also saw other powerful influences at work on this great and most interesting problem, namely, education, increase of temperance amongst all classes, better wages to the artisan workers, shorter hours of labour, cheaper food, cheaper clothing and a widespread sympathy of class with class. There was no problem of sanitary engineering of vaster range than that presented by the great Metropolis. At present the streets of London were crowded to a dangerous excess with sewers, drains, waterpipes, gaspipes, telegraph and pneumatic tubes, electric-lighting cables and hydraulic-pressure mains. No city in this world of which there was any history was ever sewered on so great a scale as London now was, and yet the main low-level sewers were too small to relieve the area bordering the river. It had at times occurred to him that deep tunnel sewers in lines irrespective of those of the streets above might be found necessary to relieve the streets. In Paris there were such large underground tunnels for sewers, gaspipes, waterpipes, and telegraph tubes and wires.

The sewage of London, now wasted at great cost to the ratepayers, might be taken to the Maplin sands, if these were embanked for the purpose, and on its way be delivered in dressings of liquid sewage over the poor adjoining lands, which

would add tenfold to their productiveness and provide useful employment for casuals clamouring at the doors of charity and crying out for work every winter. A question of vital importance was that of the present and the future water supply to the ever-increasing millions who lived and worked in London. The supply of water to London was still derived mainly from open rivers, the Thames and the Lea. The important questions were:—Must these sources be continued? Must the interests of the water companies be bought? And then, must there then be consolidation of management? If so, under the London County Council, or by a special water trust, similar to the case of the docks at Liverpool and other large trusts? When consolidation had been accomplished, should the rivers be continued as the main sources of supply for domestic purposes, or should new sources be obtained? These were wide questions and would be very costly questions. They, however, required to be answered. What were the advantages of open river supplies of water for domestic purposes, if any? Open river water might be termed "living water," as in both the Thames and the Lea the sources might be termed pure, remembering that nature did not deal in or provide pure water for any purpose. The waters of the Thames and Lea might be termed "living," as they were in unceasing motion from their sources, and the strata in both cases were geologically favourable to the supply of "sweet" water. The Conservators of the Thames had, however, allowed the abomination of house-boats to occupy the water and the banks of the river. The powers of the Conservators had hitherto been insufficient to compel some towns and villages to abstain from polluting the river which provided London with water. But must all these abuses continue? Or was there some sort of explanation for their prolonged existence? The sources of both the Thames and the Lea were as pure or as free from objection as it would be possible to find water. The waters were hard—that was, they contained about 16 grains of bicarbonate of lime in each gallon, which might be partially precipitated by boiling. These waters did not act on lead. The works were owned and managed by companies. Consolidation and purchase seemed practicable, and then any necessary extensions could be made. To bring in rival companies and to attempt to lay additional mains in the already choked streets of London would be impossible. To bring in soft water from long distances would be costly. Additional supplies of water for London might be obtained in or near the areas through which the Thames and the New River flowed.

SUNRAY CONDENSING STOVE.

WE have received from the Maughan's Patent Geyser Company the following particulars of their excellent new patent Sunray condensing stove, No. 5, for warming halls, chapels, schoolrooms, large rooms, offices, shops, staircases, public

buildings, &c. While it requires no flue, there is no smoke or smell, no dirt or trouble and it can be used either for gas or oil. It is described as a very powerful stove, designed for

warming large spaces, and it is claimed that it is undoubtedly the only gas stove which can be economically employed for this purpose, as it avoids the waste of heat which is inseparable from the use of a flue or chimney. The whole of the heat produced being utilised, it, at a cost of $\frac{3}{4}$ d. per hour for gas, will give as much heat as a radiator or furnace of the same size, and when the trouble and expense of attending to these is considered, the advantage of the patent Sunray stove is obvious. The directly radiated heat alone (from the deflecting plate and reflector) is equal to that of a bright coal fire, while the whole of the stove becomes heated and a large quantity of hot air is discharged from the top. All parts liable to rust are made of cast-iron or copper and the stove is finished throughout in the best style. The decoration can be arranged to suit any situation. It is made in two qualities—(1) Ornamentally japanned, with inlaid tiles, stained-glass, &c., as shown in engraving. (2) For situations where appearance is not a consideration, japanned in plain colours and without stained-glass and tiles.

We may sum up by saying that the special features of the Sunray, as compared with other condensing stoves, are the downward radiation of heat, warming the lower part of the room, the absence of glass or metal chimneys, the cheerful appearance when alight, and the superior finish.

COMPENSATING PLANIMETER.

IN this instrument the ideas of Mr. W. F. Stanley have been worked out by Dr. A. Amsler, the son of the original inventor of the planimeter. The Stanley-Amsler patent compensating planimeter is adjustable to the shrunk scale of a printed Ordnance map or other plan, which has shrunk in mounting, by making a correction equal to the difference between the shrunk scale and any of the four following true scales:—1/2500, 1/500, 6 inches or 5 feet to the mile and 12 inches or 10 feet to the mile, in the combined vertical and horizontal directions. To effect this a short portion of a continuous scale is placed on the instrument, which is made to read hundredths and subdivisions of the length of the tracing arm. Double the percentage of shrinkage of a plan or map gives the number of divisions of the scale engraved on the tracing arm, to which it is to be set from zero. The planimeter adjusted in this way measures the true area on the shrunk map, if care be taken to follow the outline of the area to be computed with the tracing point.

THE MARBLE ROOM, NO. 1 HOLLAND PARK ROAD, KENSINGTON.

PARLIAMENT HOUSE, EDINBURGH.

SOCIETY OF ARCHITECTS.

THE first ordinary meeting of this Society for the session was held on Tuesday evening at St. James's Hall. Mr. E. J. Hamilton, the president, was chairman. Messrs. F. C. Cuadall, F. C. Gant, W. C. Humphrey, J. H. James, V. Mitchell and A. F. Wrightson were elected as members.

The President delivered his inaugural address. He said :— In entering upon the duties of President of the Society of Architects I know not whether the sense—a very real one—of the high honour which you have conferred upon me, or the consciousness of its weighty responsibilities be the greater. This responsibility tends, of course, to increase as the position and influence of our Society grows and the scope of its operations is widened.

Permit me to say at the outset that, conscious as I am of their inadequacy, such powers as I possess shall be freely devoted to the interests of the Society. My aim will be not only to maintain, but to raise by all legitimate means the status of the Society, and also to increase the practical usefulness of its undertakings. In this endeavour I am assured that I may confidently depend upon the valuable support of the Council and officers.

In looking over the names of the men who have occupied this chair—most of whom it has been my pleasure to know—to whose untiring energies and signal abilities the Society owes much, it is, perhaps, not a little significant that four out of the six have been architects engaged more or less in practice in the provinces. Now this fact emphasises a feature of the Society's work which it is, to my mind, of great importance to keep well to the front, namely, the extension of the benefits of the Society by all practical means to architects living at a distance from London.

Far be it from my purpose to offer any discourtesy to London members, from many of whom upon the Council I have personally experienced much kindness. But I think it will be fully granted that to architects practising in London and to students residing here, there come many advantages of a social and educational kind to which men in the provinces—often much isolated from their professional *confrères*—are strangers, and to such the bond of union afforded by our Society cannot be made too real.

The report which has just been issued by your Council mentions two useful extensions of our operations, both in the direction to which I have referred.

The improved character which the Journal of the Society has during the past year assumed, both in literary excellence and style of production, is a matter for congratulation, and I would very heartily endorse the words of thanks to the editor appearing in the report. The report also encourages us to look for still further enlargement and improvement, and here again I would venture to emphasise the urgent request of the Council for the hearty co-operation of members. If a thoroughly good journal be of special advantage to provincial and colonial members—and undoubtedly it is—it is also just that feature of the work in which such members may render very substantial help by a free interchange of thought and information.

The other matter to which I allude is the visits of the hon. secretary and the secretary, by direction of the Council, to members in various provincial towns. Such friendly visits cannot fail, I think, to be of advantage, both to the members visited and to the Society. I sincerely trust, moreover, that it may be found practicable to carry out the contemplated holding of meetings in large provincial centres. To the members residing in these districts we must look to create the interest, and even enthusiasm, essential to the success of such gatherings; but, if well organised and heartily taken up, such meetings would not only be helpful to our membership, but would doubtless do much to promote an education of the public mind on the important subject of the compulsory examination and registration of architects.

The papers read during the past year have made a valuable addition to the series, combining as they have the consideration of practical subjects with more purely architectural study. Whilst heartily thanking the readers of these papers, it is a matter of regret that so few have been contributed by members.

At the close of the first year of our corporate life as a

Society, it is encouraging to be able to report a substantial increase in the membership. The total number of members and associates is now nearly five hundred.

May I express the hope that with such an enlarged constituency the numbers attending our ordinary meetings may also be materially augmented. This would be both encouraging to those gentlemen who so freely give much time and pains to the preparation of papers and also most helpful to the members themselves. The free and healthy interchange of thought upon matters relating to our art and practice has the double advantage of adding to our stock of information and confirming the opinions which we hold. It is ever true that the knowledge we impart to others becomes doubly our own.

Members must ere this be aware that the important question of examination for admission to the membership of our Society has, after careful consideration, now assumed definite shape. The scheme drafted by the Council was submitted to the annual general meeting a fortnight since. It would have been surprising if such a radical change could have been brought about without difference of opinion. Variety of opinion, however, is not generally detrimental to a cause, but frequently leads to more careful consideration of every point, and thus secures in the end a better result. In my judgment it has been so in this case. But whatever be the opinions held and freely ventilated during the time for discussion, it is the evident duty of every member, and more especially of the Council and officers, now the matter is definitely settled, to use every endeavour to carry the matter forward to a successful issue. (The President then read the decisions arrived at at the general meeting.)

In order to avoid misapprehension, it cannot be too distinctly stated that, in taking this action, the Society of Architects aims at no rivalry or competition with any other body. It is only following a course which is not unusual amongst other professional societies, and one, moreover, which is in perfect consistence with its steady promotion of the scheme for universal examination and registration of all architects.

The only object sought is one which, it seems to me, must commend itself to an unprejudiced judgment, namely, the guarding of the Society against incompetency, and securing that every one elected to membership shall have a reasonable claim to be called an architect. The provisions for a students' section have my very warm approbation, and I sincerely trust that the advantages presented will be largely embraced by pupils and others.

I referred at the outset to the steady growth in the position and influence of our Society. The extension of our membership into the colonies and other countries—the publicity afforded through the Press—the promotion of the Bill for Compulsory Registration of Architects, and lastly the incorporation of the Society, have all doubtless contributed in varying measure to this growth.

But let us never lose sight of the fact that real success and advancement both for the Society and for the profession at large depends upon ourselves. Upon what we are as men and the works we achieve as architects, more than upon any external or accidental circumstance, will depend the position we realise for ourselves, and indirectly the success and status of our Society.

With this thought as a thesis, I venture to draw your attention briefly to a few considerations affecting

The Practice and Province of the Architect.

Foremost amongst the essential elements of architectural practice I would place what I may describe as an artistic sense, the faculty of recognising and enjoying the beautiful in all things. And, more than this, an open vision to see and wisdom to understand the great underlying principles out of which all true beauty, whether in nature or art, grows.

Vital to an enjoyment of this vision of truth and beauty is a full development of our highest powers; for truth and beauty are divine whether in nature or art, and will not reveal themselves to the ignoble. But this faculty must be exercised and it will always grow by training. By long and patient study alone can these great principles be discovered, and by practice alone can they be fitly applied to our works.

The direction of the student's work will depend much upon his tastes; but a study of the best examples in Classic, Gothic and Renaissance architecture is certainly desirable. The aim of such studies should be fundamental, not with the object of slavishly copying, but of learning the principles upon which the builders wrought, and thus it will often be found that some of the principles are the same in widely differing styles.

We are often twitted in this country with having no national style, but, as the Americans say of our weather, possessing "samples only." I take it we must admit the criticism. But may not this fact be due in some measure to the oftentimes wrong direction of our studies? It is scarcely a generation back since it was a common practice to regard ancient Classic examples as objects to be copied bodily, at least as to elevation. The interior purposes of the new building might even be

wholly different from those of the original, but convenience of plan had to succumb to an imposing façade. The Gothic revival only in a measure mended matters for a time, for a somewhat slavish copying of detail apart from a proper understanding of principles became the fashion.

This period through which we have now happily passed has doubtless had its uses, nor can we yet afford to set aside a careful study of ancient and Mediæval art. It were, indeed, far better to copy bodily a good design than to invent a bad one. But the evil is that buildings, like plants, are often indigent to the soil and ill-adapted for transplanting to another clime. Though the maxim is not a new one, we have perhaps not yet come fully to understand how a national style can scarcely exist, at least can only be good, as it grows out of and fitly expresses national habits and characteristics.

But when we speak of the "practice" of the architect, the word itself suggests that something more than the possession and efficient training of the artistic sense goes to the making of an architect. He must also undoubtedly possess not a little practical knowledge of several sciences. Men and women have to live in the houses he designs, and to experience comfort or the reverse in using the various structures whose erection he superintends. The health of the community depends much upon his knowledge or ignorance of sanitary laws, and safety to limb and life may often hang upon the proper disposition of the materials he uses.

To the vexed question whether an architect should be an artist or a theoretical mechanic, I would reply, in a measure he must be both, and a man of business too. An artist may be a thoroughly unpractical man, no man of business, and yet a good artist; an architect cannot. On the other hand, neither has the mere mechanic or man of business, with perhaps but little art sense and no art training, any claim to call himself an architect. He may be well versed in the science of building, and able most efficiently to conduct the business of his client, but he cannot be a true architect unless he be a true artist. Lacking this, though his buildings be very ornamental, the ornamentation will probably be vicious, and though his work secure many admirers, it will inevitably be devoid of the elements of true beauty, and transgress at every point canons of good taste.

Time will only permit of a brief mention of two features of the times which present special hindrances to architectural practice. The mania for cheapness thwarts us at every point, often curtailing expenditure below reasonable limits, and tempt-

ing to the improper use of materials made to imitate the functions of more costly substances. The multiplication of specialists' manufactures by way of fittings and decorative features, though it sometimes saves us trouble, tends to sameness of treatment and loss of originality, and often unhappily to the fostering of a vitiated taste for showiness and a wholesale destruction of true art.

The qualifications for the practice of architecture which I have endeavoured thus to trace (though, I fear, very imperfectly) are wide in their range, and certainly such as to make large demands upon the powers of most men. I think, however, you will be ready to admit that they are not unreasonable. But does not every consideration of the subject point again to the absolute need for a careful education and training for every architect?

Let us now turn from the qualifications for the practice of architecture and inquire what are its limitations. What is the province of an architect? One thing must be evident from our previous survey. Unless he become a specialist, the variety of the buildings which an architect may be called upon to design will of itself present a wide scope for the exercise of his talents. He may be to-day designing a church and to-morrow a dwelling-house, school or factory. He need not, it is true, have a previous knowledge of all the technical requirements for which such buildings, for instance, as factories are needed; but he must be able readily to grasp these requirements, to invent methods for overcoming difficulties, to guide and advise clients who often scarcely know their own needs, and to throw all into forms of beauty framed out of suitable and enduring materials.

Such duties are not light, and surely a man with any amount of practice might find in their faithful exercise ample scope for time and genius. And what are the facts of the case, gentlemen? A study of local directories would lead us to suppose that many architects must, indeed, be men of Herculean powers. In fact, architecture seems to have been tacked on as a light and pleasant pastime relieving the more serious occupations of house agency and upholstery. A notice-board not far south of London announces the happy combination of "architect and coal-merchant," while I have heard on good authority of a certain publican who varies the tedium of drawing pints of ale by designing and superintending the erection of hotels and taverns.

There is, of course, an evident unsuitability in such combinations as these. They approach the ludicrous. But in these days of keen competition it becomes a matter for quite

serious discussion what occupations, if any, beyond his evident sphere, an architect may fitly engage in. It would often doubtless be to his pecuniary advantage to undertake house and estate agency. It must, however, always be to the detriment of his art. If such a combination can be justified at all, it should at least be by way of recognised partnership, the partner who has been trained as an architect having freedom to give his undivided attention to architectural work.

It has always appeared to me perfectly legitimate and sometimes advantageous for an architect to take out his own quantities. He must know best his own intentions, and if he has a proper knowledge of the science should be best able to make the quantities a true expression of those intentions. An architect in large practice will, however, not often have time for this. When the work is done by a surveyor he should be working in full concert with the architect, and whether the quantities form a part of the contract or not, it would be better if they were always recognised and paid for by the employer.

Land surveying and the laying-out and development of estates is another large branch of work in which architects frequently engage.

As regards the former, it is certainly admissible for an architect to measure and level the sites for his own works and he should at least be able to do this. In respect to the latter, it would doubtless be much to the advantage of the estates if an architect had at least some share in their planning. In this as in other matters very much must depend upon the time at his disposal. I cannot see that there is necessarily in the work itself anything inappropriate or injurious to the proper exercise of architectural art.

Surveying for dilapidations is another branch of work which, at least in the provinces, is always regarded as coming within an architect's practice. It is certainly one which his general experience specially fits him to perform judiciously.

The question whether architects should advertise opens an oft debated point. Much depends upon the manner of advertising. It cannot reasonably be denied to an architect to use some legitimate means of making himself known. But should not his works be his best advertisement? and why should he not place his name upon them in some modest spot as an artist or sculptor does? There is something very different in this from the ordinary trade advertisement. For myself, I much doubt whether advertising in the ordinary trade sense is of any use to an architect; but whether it be so or not, it is utterly repugnant to good taste.

The following is an actual specimen of this kind of advertising, which fortunately has not yet become common amongst architects. "Designs for chapels and schools. Pretty, inexpensive, free from damp and echo. Upwards of eighty have been erected during the past eight years and the demand is still increasing." And then follow paragraphs headed, "architectural beauty, echo, damp, ventilation, extras and disputes," &c., in all of which points the author claims exceptional success. The circular closes with an offer to forward photographs or lithographic views of chapels in various styles at a charge of 6d. each below 400 sittings and 9d. each above. Comment is superfluous. I am tempted, however, for a moment to translate it into another sphere and to read:—"A. B., poet. Poems of all sorts composed at the shortest notice. Heroic odes, pathetic verses, elegant elegies. Specimens sent on application."

It is not always easy to stand against the fashions of such an advertising age, in which literary men and even ecclesiastics are sometimes led into the stream. But, to my mind, all eulogistic comments upon the creation of one's own brain are out of place, and must so tend to lower one's higher sensibilities as to become reflectively injurious to our art. It behoves us therefore, as a Society, very strenuously to set our face against such practices.

Against the acceptance by architects of commissions from manufacturers and others it is scarcely possible to utter words too strong. Architects are doubtless often put to much trouble in selection, and the unwillingness of clients to fairly remunerate for such work is strong inducement to them to seek their commission elsewhere. But the argument is specious and insufficient to uphold what can only be characterised as deception.

My aim throughout has been to demand a high standard in the exercise of our art. With class distinctions of trade and profession I have little sympathy. A calling is honourable as it is exercised honourably. Every man who does his best, whether in art or craft, is worthy of respect. But assuredly all callings do not require the same degree of ability. And without any invidious comparison, it may safely be averred that the practice of architecture ranks high amongst the professions, as one making large demands upon talent, study and close application.

It is on these grounds that I would urge the limitation of architectural practice, as much as possible, to what is certainly the main province of the architect, namely, the designing and superintending the erection of buildings.

A vote of thanks to the President was proposed by Mr. H. Lovegrove and seconded by Mr. M. Shelbourn. The annual report and balance-sheet were unanimously passed by the meeting.

CONTRACTING IN AUSTRALIA.

MR. JOHN ROBB, a well-known contractor, recently sequestered his estate. At his examination in the Melbourne Insolvency Court, says the *Australian Builder*, it was stated that when the insolvent filed his complete schedule on May 3 last his liabilities were 681,505*l.* and his assets were 448,528*l.*, leaving a deficiency of 232,977*l.* The insolvent attributed his failure to depreciation in the value of the investment stocks and real estate, losses in squatting and sugar planting, and losing an arbitration case with the Queensland Government in connection with the Cairns railway, for which he was a contractor. In 1889 a balance-sheet made of his affairs gave a surplus of 445,344*l.* The schedule showed that within two years and nine months of his insolvency he lost 522,163*l.* In those same two years and nine months a profit was made on his railway contract in Queensland of 123,914*l.* He had a claim against the Queensland Government of 262,311*l.* in respect of his contract, which was referred to arbitration, and he obtained an award of 20,807*l.* on it, but the arbitration cost him 26,000*l.* Before the arbitration he was offered 100,000*l.* by the Government.

TESTING WHITE LEAD.

THE following suggestions for testing the quality of white lead are offered by the American Association of Master Painters. Coat a board primed in ochre with a mixture of one ounce of oil and two ounces of lead. Then put on a second coat over the entire face of board, excepting a small portion in the middle. When this is done, put a third coat over all, excepting another small space, with a mixture also of one ounce of oil and four ounces of lead. Allow one week to elapse between each coat and paint the boards while in an upright position. The board will, when finished, have been painted as follows:—In the middle there will be a narrow space showing ochre priming and on the left of it another similar space of one coat of lead; on the right of the ochre priming space, as well as on the left of the one coat space, will be similar small spaces, each

being covered with two coats, and on the right and left respectively of these will be a larger space, covered with three coats. After the last coat has been on three or four days, place the boards where they will get a southern exposure and if put over a roof at least two feet above same. If the boards are dry to the touch they should be placed out of doors for a day or two between coats. The brush should be used to finish the mixing and the boards should not be sand-papered. The test being one of comparison a separate board must be painted with each of the leads about to be tested. It will not be necessary to use a separate brush for each board if there are so many of them. Benzine is chosen as being more volatile than turpentine to wash out the brushes. Keep the brushes in oil when not in use. The test is intended principally as one of durability, and as after long exposure the covering qualities of the different leads will not be easily determined, they should be noted at the outset.

THE SURVEYORS' INSTITUTION.

THE first ordinary general meeting of the Surveyors' Institution for the season was held on Monday evening. Mr. Thomas Chatfield Clarke, the president, delivered an opening address. In this he remarked that in 1872, when he first joined the council of the Institution, they had but 279 of all classes, including a humble contingent of four students, on their roll. Since that time the figure had, in spite of natural losses, mounted to nearly 2,400 of all classes, including a body of close upon 200 students. These figures indicated a great material success, and bore testimony not only to the position which the Institution occupied in relation to important interests, but also to the extent to which it had fulfilled its duty to the profession which it represented. But if they were to prosper in the future as in the past, and were to keep in touch with the times, they must be careful not to rest content with obsolete ideals. There were everywhere signs of departure from old landmarks, from principles which, however unchallengeable a few years ago, and however defensible in the abstract at the present time, were getting, not necessarily by any fault of their own, "out of correspondence with their environment." The spirit of unrest that was making such headway in every country in Europe was just now addressing itself with special vehemence and pertinacity to questions affecting property, an institution which, of course, lay at the basis of all national stability and progress. He was one of

those who held the belief that nothing would be more calculated to paralyse our national life than the wide prevalence of the preposterous demand for the nationalisation of all property, which had lately found favour in quarters from which better things might have been hoped for. But, while condemning in the fullest manner extravagances of that kind, he felt that they would not be serving the cause of order and social stability if they allowed themselves to be drawn into an unreasoning advocacy of every franchise and privilege, unless it could be defended on grounds of abstract right and strict justice between man and man and unless it was adapted to the wants of the time. There was probably no body of men who possessed, by the necessities of their calling, more practical sagacity than the surveyors of England, and it was his sincere hope that they would be found, in the difficult times which might shortly come, co-operating with the best intelligence of the country in the endeavour to protect the institution of property, less by an insistence upon strict theoretical rights than by placing it on such an equitable basis as would command the confidence and assent of the large mass of the community.

From a professional point of view there has been no more important piece of legislation in recent years than the London Streets and Buildings Act, which received the royal assent on August 25 last. It may be worth while to place on record in this address the genesis of the new measure and to indicate the leading share which the Institution has had in moulding its provisions in the various stages of its evolution. For many years past it has been felt that the Act of 1855 has been outgrown by modern requirements, and that the existing law was insufficient for regulating many details of new construction and materials. Endeavours have been made to cure this by several auxiliary enactments, and by by-laws framed by the Metropolitan Board of Works, and subsequently by the London County Council, under the Metropolis Management and Building Acts Amendment Acts, 1878 and 1882. It was felt, therefore, that the time had come for the codification of the law relating to building, and the first step taken in the matter was the production of a draft Bill under the title of the London Building Law Consolidation Bill, issued by and apparently prepared under the auspices of the Local Government Board. Copies of this draft Bill were forwarded to the Institution and to other Societies, accompanied by a request that the Institution would furnish the Department with comments on the Bill. The Council pointed out, in reply, that what was really wanted was not consolidation, but a new Act; but on being further pressed for suggestions they appointed a strong committee, who devoted a large amount of time and labour to the work of engraving on the Consolidation Bill the additions and amendments in their opinion necessary for making it a useful working measure.

The matter apparently slept until, in December of last year, the Council received copies of a new Building Bill, prepared by the London County Council, embodying some of the suggestions made by the Council of the Institution to the Secretary of State in connection with the Consolidation Bill already referred to.

The building committee of the Institution devoted a very large amount of time to the consideration of the new Bill, and finally nominated their colleagues, Mr Rickman, Mr Garrard, Mr Steward and Mr Cubitt Nichols, to represent the Institution at a conference with the building committee of the London County Council, and to press the adoption of the amendments proposed by the Institution.

They were met in the matter in the most friendly way by the representatives of the London County Council, but failing to obtain concessions on some important points, they were authorised by the Council to draw up and lodge a petition in opposition to the Bill.

After a prolonged fight in the committee-rooms of the House of Commons, the representatives of the Institution (for this purpose Mr Steward, Mr Garrard and Mr Cubitt Nichols) succeeded, themselves or in concert with others, in modifying or getting rid of most of the more obnoxious features of the Bill, and were able to appear in support of the greater part of it before the committee of the House of Lords. The Council and particularly those members of it referred to have spared neither time nor trouble in the endeavour to secure a Building Act worthy of this great Metropolis, and although it has involved the Institution in an expenditure of nearly 900*l.*, the members must feel that the money had been well bestowed.

Mr. Clarke said he must also congratulate the Institution on the position accorded to it by the Act, in relation to the Tribunal of Appeal. The position conceded to the Institution nominee by the London Council General Powers Act, 1890, is greatly emphasised in the present Act by the establishment of the tribunal on a formal basis and by the great enlargement of the scope of its operations. The willingness of the London County Council to refer appeals on technical matters to a tribunal of experts may be justly said to be a strong testimony to their desire to act fairly as between the various interests involved.

The subject of betterment we must regard for the present as in a state of suspended animation, owing to the action of the House of Lords in excising the clause which embodied it from the County Council Bill; not on the ground, judging by their report on the general question, that the principle is itself unjust, but that it has not yet been clothed with any practical plan for putting it into equitable operation. It is only the extreme opponents of the principle who deny in the words of the Lords' report, that "persons whose property has clearly been increased in value by an improvement effected by local authorities should specially contribute to the cost of the improvement." The whole difficulty arises from the incertitude of the operation of a public work in raising the value of neighbouring lands, and it is noticeable that the Lords point out that the evidence of eminent valuers is in conflict on the question. He for one was not disposed to quarrel with some of the proposals of the Lords' committee for protecting from possible injustice the persons to be charged with a "betterment" rate. It is fair, for instance, that within a reasonable time after the completion of the work the owners of the properties affected should receive notice of the amount of the special rate which the local authorities propose to impose on them; but this does nothing to remove the difficulty of deciding whether the period is sufficiently long to adequately test the effect of the improvement, or so long (after the execution of the improvement) as to damage the market value of the property. But it is, of course, the peculiar duty and province of a surveyor to estimate and advise on such questions.

He was not sure that he could give an unqualified acquiescence to the proposal to give the person to be charged the option of going before a jury; not that he had any feeling as regards the fairness of this "Palladium of British liberty," but because a jury is summoned *ad hoc*, whereas the decisions of an arbitrator, dealing with all matters arising under the scheme, would be more likely to result in an equitable distribution of the charge among the various persons affected.

The "worsement" principle is reduced to the narrowest limits by the proposal of the Lords' committee to confine it to property, in the immediate neighbourhood, belonging to the owner charged with the betterment rate. It is not probable that many claims of this kind can arise, or could be substantiated if they did arise, and the contingency, thus limited, may fairly be disregarded in considering the question. He could not, however, agree with the proposal that, where the "owner is of opinion" that the charge exceeds the enhancement of market value due to the public improvement, he should be entitled to claim that the Local Authority should purchase the property in question at its previous market value. Surely a right to compel the Local Authority to purchase should depend upon something more tangible than the "opinion" of the owner, and he could not think that the suggestion was put forward seriously. There can be no objection to the settlement by arbitration of any question that arises as to the incidence of the betterment charge between any of the persons entitled to different interests, though it would seem that the matter could be better dealt with by the publication of example cases after the manner, though not necessarily on the lines, of those prepared by our associate, Mr. Harper, in connection with the question of the rating of ground values.

There was a good deal of evidence before the Lords' committee with reference to the alternative principle of "recoupment," some of it of a very conflicting kind. The report seems to imply a preference for this method of recovering the cost of an improvement and a belief in its sufficiency, if the local authorities can be relieved of the necessity of buying out the trade interests, these having so far proved most costly in carrying out the large schemes in the Metropolis and elsewhere. Personally he doubted the advisability, from the point of view of public policy, of allowing local authorities to become land dealers on a large scale, and the experience of some few years since in this direction should be a warning to avoid what then proved to be a great scandal.

On the whole, notwithstanding the temporary *impasse*, he thought the air had become to some extent cleared by the fiery ordeal through which the question has passed, and that a plan will yet be found of imposing in an equitable way a charge which most people agree is not inequitable in principle and essence, and which might operate with advantage by reducing the cost of metropolitan improvements, and thereby increasing the extent of many needed works.

SEWAGE PURIFICATION.

A REPORT on sewage purification has been prepared by Mr. T. Hewson, the Leeds city engineer. During the last few years the streets and sewerage committee have inspected the sewage works of eleven towns. At Acton, Middlesex, with a population of 23,000, the sewage from about 10,000 is treated by precipitation and filtration. It is treated with a liquid called

ferozone, for which the International Purification Company hold a patent, and which costs 2*l.* 5*s.* per ton delivered. There is a sale for the pressed sludge at about 4*s.* 6*d.* a load, and some of the pressed manure is ground and sold at 30*s.* a ton. The county borough of Croydon cleanses its sewage upon two irrigation farms. One of them contains 616 acres, of which 451 are utilised, and there the sewage of a drainage area of 6,300 acres and of a population of over 85,000 is treated. Mr. Walker, the borough surveyor, who has been intimately connected with the management of the two farms for twenty-three years, states that almost any kind of soil and subsoil will cleanse sewage by broad irrigation; that as a part of the land has been under irrigation for thirty-four years, and is to-day in as good a state to cleanse sewage as it was at the beginning, it may be inferred that under fair management land will always retain its power to cleanse sewage in that way; that the working expenses of a broad irrigation sewage farm will generally be covered by the receipts from the produce grown upon it; that no nuisance will be created by a sewage farm if properly managed, and that sewage can be properly cleansed by broad irrigation all the year round. At Wimbledon the methods adopted are precipitation, followed by filtration, partly through filter beds and partly through land, but owing to the difficulty of acquiring land of a suitable price and character, the lands now used for broad irrigation are being converted into specially constructed filtering areas, the filtering materials being composed of burnt clay found in the land. At the London Sewage Works, at Barking, a normal daily flow of about 100,000,000 gallons of sewage is satisfactorily treated by precipitation, the resultant sludge, to the extent of 2,500 tons per day, being sent to sea in steamers and discharged. The cost of the whole works was about two and a half millions sterling. At Ealing the precipitation process is adopted and the sludge is burned, along with house refuse, in a destructor which obtains a very high heat by having a cremator attached. Since the cremator was added no complaint has been made about the destructor. The destructor costs about 3½*l.* per ton, exclusive of capital charges. Birmingham sewage is cleansed by precipitation and irrigation, the total area of the works and farm being 1,299 acres. The contributory population is 650,000 and the daily dry-weather flow of sewage over 22,000,000 gallons. Although the net result shows that irrigation almost pays its own working expenses, there is a dead loss of over 12,000*l.* on the precipitating and tank process and the total charge on the rates for sewage purification for 1893 was 33,000*l.* Fruit, celery, cabbages, mangels, ryegrass, &c., are grown on the land very successfully and from 160 to 170 milch cows are fed upon a portion of the produce. The yearly average yield of milk is over 850 gallons per cow and the whole supply in 1892, when the committee visited the works, was sold to one customer, who paid 6*d.* a gallon in summer and 8*d.* a gallon in winter. At Sheffield from seven to eight million gallons of sewage a day are dealt with by precipitation and the works cost 8,000*l.* or 9,000*l.* a year. Difficulty is experienced in getting rid of the sludge. Blackburn, which was one of the first towns in England to attempt the purification of its sewage, employs the broad irrigation system. The land is let off to tenants, who take the sewage as they require it, but no profit accrues to the Corporation, as the rents only amount to 1 per cent. on the original outlay. Owing to the unsuitable nature of the land already used, further purification of the sewage is needed, and precipitation tanks are being, or have been, erected for the purpose of preliminary purification. On the occasion of the visit of the committee the temperature was below freezing point, but where the land had been in actual contact with the sewage for a few hours it was not frost bound. The broad irrigation principle is also adopted at Dewsbury, and the crops are principally mangels, carrots, turnips, beans, rye grass, comfrey and osiers. The whole of the land is always producing something. Thirty-three dairy cows are kept, and the produce they and the horses do not consume finds a market. Neither factory nor dyeworks sewage is admitted into the sewers. The effluent is a good one. At Manchester precipitation and irrigation works are in progress, and partially in use. At Huddersfield precipitation tanks and filter-beds are employed, the sludge being destroyed in a house-refuse destructor. In 1870 the immediate necessity of purifying the sewage became evident to the Corporation of Leeds, and it was eventually decided to construct experimental works on the precipitation system, and to adopt the process of the A.B.C. or Native Guano Company, the Corporation granting a lease of the works to the company for twenty-four years. In 1874 the permanent works were completed, the total cost being 57,524*l.* 1*s.* 2*d.* Details of the process are given in the report. It is sufficient to say here that in October, 1871, the Native Guano Company commenced to purify about one million gallons of sewage daily, and that they obtained an excellent effluent, bright and clear and free from smell or taste. But the expenses proved greater than had been anticipated; difficulty was experienced in selling the manure at a remunerative price, and in 1873 the company were released from their contract. Various experiments were afterwards tried in turn

by Mr. Sylvester Fulda, General Scott, Mr. Rupert Goodall, of Armley, the Native Guano Company, Mr. John Hanson, of Dewsbury, and again in 1876 by the Native Guano Company. The processes of Mr. Goodall, the Native Guano Company and Mr. Hanson, which are described in the report, were chiefly dependent upon lime, and in most cases difficulty was experienced in extracting the colouring matter discharged from the dye-works from the sewage. Since 1876 the Corporation have had no further experiments and the precipitant used has been lime only, the quantity being about a ton per million gallons of sewage. The effluent is most satisfactory, the discolouration from dye being only periodical, and then very slight. Though the sewage sludge largely accumulated so long as any charge was made for it, the farmers now that they get it free remove all that is made. The revenue expenditure for the year ended March 31 last on the sewage purification was 5,660*l.* 7*s.* 8*d.*, this of course being exclusive of interest on and repayment of capital.

ENGINEERING WORKS IN EGYPT.

ON Saturday evening Sir Colin Scott Moncrieff delivered a lecture at the Working Men's College, Great Ormond Street, on Egypt and the Nile. After observing that the cultivated valley of the Nile, which alone is Egypt, was only about 10,000 square miles, or half as big again as Wales, or one-eighth of Great Britain, and after a short narrative of the recent history of the country, he described in detail the engineering work which had been accomplished during the period of British occupation. The old system of irrigation in Egypt, he said, which made it the granary of the world, only dealt with the Nile in flood. A line of embankments was made along each edge of the river, too high to be topped even in flood. At right angles to these, about five miles apart, other embankments were made, going right across the valley and so dividing the country into a series of oblong areas. Short canals were cut from the river into each of these areas or basins, as they are called. As the river rose these canals filled, and the whole basins were flooded 3 or 4 feet deep. The still water parted with its mud and thoroughly soaked the ground. In October the river began to fall; the water was run back into it and the basins emptied; then, as soon as a man could walk across the mud with a pair of bullocks and a wooden plough, or even the branch of a tree, the mud was turned over and sown. So soaked was the soil that the wheat or barley at once sprung up, and without a drop of rain or any further watering a fine crop was reaped in April, and then the field lay baking in the sun till next flood. Such was the ancient system, and it has come down from the time of the Pharaohs, and is the system to this day throughout the greater part of Upper Egypt.

But in this century a change was introduced. Egypt was for many years ruled by a very sagacious although unscrupulous man, Mohammed Ali Pasha. He saw that with its soil and with its climate Egypt could grow something more profitable than corn. Europe could pretty well feed itself with this commodity, but Europe could not grow cotton and sugar-cane products of great value, which Egypt could grow quite well if only they could get water all the year round, for the cotton must be sown and the cane planted in March, and from that time onwards throughout all the heat of summer they must be regularly watered. The water was there, flowing out to the sea, but how could it be raised on to the land? I have told you the Nile rises 25 feet; so a canal flowing 12 feet deep during flood has its bed 13 feet above the river level when the Nile is at its lowest. Mohammed Ali began by cutting a great system of deep canals all over the Delta, into which water would flow when the river was low, and from these canals by various rude contrivances it was pumped up and poured over the land. But this was a great labour, and worse than this, when the flood came the deep canals became choked with mud, and had all to be dug out again.

Then some one advised that a great dam should be built across the two branches of the Nile at the apex of the Delta, and the water raised just as it is by a mill dam in this country, and a great work was started, known by the French name—the barrage. It consisted of a bridge over each branch of the river, one consisting of sixty-one, the other of seventy-one arches of 16-feet span. These were to be fitted with drop-gates, to be kept down during low Nile so as to pond up the water, and to be raised out of the way during flood. The water held up was to flow down three great canals—one on the east side of the eastern branch of the river, one between the two rivers, one on the west side of the western branch of the river; and from these canals into minor canals, and at last on to the fields. The barrages were finished in 1861, but gates were only fitted into one. Signs of settlement appeared, and in 1867 a great crack split the whole bridge from top to bottom. The Egyptians did not know how to mend it. They did not believe it could be mended, and went back to the old system of digging out their deep canals.

When I got to Egypt everyone said, "Whatever you do, do not touch the barrage; it is hopelessly unreliable." But my companions and I felt, if we were to do any good, we must either put this great dam right or build a new one, for it was absolutely necessary to get control of the Nile water. So we resolved to see what the cracked dam was worth. When the gates were open there was no more pressure on the barrage than on an ordinary bridge, but when they were closed the water above was calculated to rise as much as 13 feet higher than the water below, creating a heavy pressure on the work, and as it was founded only on sand and mud the tendency of the water would be to work its way under the foundations, scouring out the soil till at last the whole work might fall in. We found on the Rosetta or western branch barrage (the only one in which gates had ever been fitted) tremendous cracks through two or three arches, but still we resolved to test the work. If it smashed there was no very great harm, while if we could anyhow make it stand the gain would be enormous. On the other hand, there was a host of jealous foreigners delighted to see an English failure. In January 1884 an excellent English engineer took up his residence at the barrage. The first thing to do was to put little patches of cement every here and there across the cracks, and these were all numbered. Then about 26,000*l.* were spent in strengthening the rough stone protection below the bridge and in replacing new timber for the old. All this time the river was slowly falling. We resolved after it fell to a certain point to begin to close the gates. Daily the river kept falling. Daily we closed another gate, and daily the English engineers went round all the little patches of cement. We feared that, as by closing the gates the water rose up stream, the pressure would be too great for the work and the cracks would open out afresh, in which case our little cement patches would crack too. So long as they showed no crack, so long we knew there was no fresh mischief at work. We had to proceed very carefully and it was anxious work, but at last we had raised the water 7 feet 2 inches and then I thought that enough for 1884. This made a tremendous difference to the cotton crop. I have said the water was intended to go into three main canals, but only one of these, the central one, had ever been properly finished. The eastern one had never been made at all. The western one was half full of desert sand. But the centre one this year contained 7 feet of water more than it had ever done before in the hot parching months of May and June. And the result was that the cotton crop, which had never before exceeded 130,000 tons, came this year to 160,000,

and as each ton was worth about 55*l.*, these additional 30,000 were worth 1,650,000*l.*, which was not a bad return for the 26,000*l.* we had spent. This was so encouraging that the following year Lord Cromer, in spite of the low state the finances were in, managed to get a million sterling, which was made over to us to spend in putting right the irrigation works of the country. Then we knew we could repair the barrage thoroughly. We got four more trained Englishmen from India and set about the work. A distinguished English engineer had offered some years previously to repair the work and he proposed to do it by sinking a great wall right across the river, to go down 60 feet below the bed, and this he estimated would have cost alone 1½ millions. We resolved not to try it, first because it was so dear and also because we feared that if we dug any such hole the barrage might slide into it bodily. The task was very difficult. We had to shut off a piece of the river, enclose it with a bank, pump out all the water to the very bottom, then examine the state of the foundations and do what was necessary to strengthen and repair it. We were not certain if we could lay bare the foundations like this. The falling flood would not let us begin before November, and the rising flood of the next year forced us to close at the end of June. In March, 1886, we made our first earthen embankment round twenty arches at the west end, which was the part most badly cracked. We pumped out the water from within, and found that by keeping steam-pumps constantly at work we could keep the bed of the river quite dry, although the water was 18 feet deep outside. The cracks looked worse than we had expected when we got right down to the floor, but it was a great thing to have got down. Soundings had told us that for more than 200 feet deep there was no rock to be found below, only sand and mud. We were required to prevent the water passing through this under the work, and yet it was impracticable to make a very deep foundation and to rest on firm rock. We resolved, therefore, to adopt an Indian plan, and to spread the foundations out very wide. We found that from up stream to down stream the width of cracked, badly-built flooring was 112 feet. We just doubled it to 224 feet. We covered the old flooring with a solid mass of concrete and stonework 4 feet thick and prolonged it up and down stream, while along the upper edge we drove a line of what is called sheet-piling 16 feet deep, *i.e.* wooden piles dovetailing into each other so as to form a continuous wooden wall, so that the water would have to percolate under this wall and through 224 feet of sand and mud before it could get out on the down-stream face. That first year, 1886, was only a trial

year. But we finished the flooring of sixteen arches like this, placing just below the bridge heavy dressed blocks of hard stone, which we got from the Alps. At the end of November 1886 we began our preparations for next season. We could not close off the whole of either branch of the river any one season, but we determined to do a half. And as there were two branches, that meant four years' work. It took us till the middle of February to get our embankments round one-half of one of the barrages. It took three weeks longer, with twelve steam-pumps working day and night, to get the water out of the enclosed space. Then in March we set to work, and went on day and night without a break, working at night by electric light, till the end of June. I remember on July 1, 1887, we had finished one-half of the Rosetta barrage. We had daily reports of the progress of the floods, and got the last of our steam-pumps out of the bed that day. Before daylight next morning the flood was over the whole floor. The embankments, which had taken us three months to make and had cost about ten thousand pounds, were all washed away by the rising flood, and no work was possible till the middle of the following November, when we began new embankments, enclosed another half of the river and did another hard season's work. We had sometimes as many as 10,000 men at work—Arabs, of course, chiefly, Maltese, Italians, Greeks, Syrians, a few Frenchmen. There were perpetually new difficulties meeting us. Sometimes in the middle of a nice, clean, new piece of stone flooring a great spring of water would burst out and cover the whole with black mud, and rise deeper and deeper till it was stanchied. But by careful management the engineers in charge triumphed at last, and on June 16, 1890, they reported that all was finished up to water-surface line. We could take away the embankments then with safety. Since then no one has seen the dry bed of the Nile, nor, I trust, will see it for many a day to come. Altogether, about 460,000*l.* was spent on this work, and Egypt is yearly the richer by an increase in the cotton crop worth at least two and a half millions sterling.

That has been the biggest and, on the whole, the most difficult work the engineers have done in Egypt, but there have been many others. The great canal at the east end of the barrage has been constructed; that at the west end has been remade. One curious bit of work was moving the Nile itself about a quarter of a mile east, so as to get it to come straight on to the barrage. This was done in about five years by building out stone groynes on the west side and so forcing the current to turn eastward. Where these groynes were built

in water, sometimes 40 feet deep, there are now fields of corn, and where there were fields there is now deep water. As irrigation without drainage always tend to injure the soil, and as drainage had been quite neglected, it had to be taken in hand? and when I left Egypt two years ago about 1,000 miles of drain had been made. The canals having been intended for irrigation only, the wants of navigation had been totally neglected. We had therefore to select certain useful navigation lines and supply them with locks and swing-bridges to allow the Nile boats to sail freely through them. Throughout the greater part of Upper Egypt the old system is still employed of irrigating only during the floods. There is always at such a season plenty of water in the river, but unless it rises to a certain height it cannot flow over the land. This has been remedied now. About 385 miles of new canal have been made; about 300 more of old canals have been widened and deepened; more than 100 new masonry works have been made—bridges, sluices, tunnels for passing one canal under another. All these have cost about 800,000*l.*; and now, however feeble the Nile flood may be in the future, it is sure to get on to the fields. You will see, then, that the state of the river at all seasons has been provided for. By means of the barrage the whole of the water when the river is at its lowest, in May or June, is poured on to the fields, and none escapes to the sea at all, while by the measures adopted in Upper Egypt, however defective the annual flood may be, there is no fear of any part of the country not obtaining water.

One reform second to none has been carried out—rather a social and moral than an engineering reform. Since the Jews made bricks for Pharaoh the habit of the country has been to execute their public works by forced labour. In 1883 there were 85,000 men employed from January to July in clearing canals and making embankments. Forced from their villages under the lash, receiving not a penny of wage nor a mouthful of food, they were kept at work half the year. This was so much the custom of the country and it was so cheap, that it was not easy to overturn the system. But we Britons were not going to let this go on. We were told the Egyptian peasant was such a lazy fellow that he would not work for wages and must be forced. We said, "Let us try." By degrees money was forthcoming, and now the Egyptian labourer works as freely as the Englishman except in one particular work, and the cost of his labour (400,000*l.* a year) goes into his pockets (or would if he had pockets), and helps him to live better and to pay his taxes. I must not, however, omit to tell you where

ENLARGING AND MAGIC LANTERNS.

"OPTIMUS" ETHO OXYGEN SAFETY SATURATOR.

Price complete with Jet, 70*l.* each.

FREDERICK E. IVES, of colour photography fame, said in a recent address:—"In my opinion the best of these inside-lantern Saturators yet produced is that of Perken, Son & Rayment, of London. . . . It will not become unduly heated in the lantern, as some of the others might, and is a model of compactness and convenience. I think so much of it that I have adopted it for my own use."

"OPTIMUS" 100 CANDLE-POWER LAMP.

Price, Three Wicks 2 in. wide, with Lantern complete, 65*l.* each.

Nature.—"Lanternists will be glad to learn that Perken, Son & Rayment have introduced a new oil lamp, possessing THREE TIMES THE CANDLE-POWER of those hitherto used for lantern projection. For small audiences the lamp will suit a lecturer's purpose quite as well as the limelight."

he is still forced to work. It has always been the custom to force the peasantry to turn out during the Nile flood to mount guard on the long miles of embankment and to see that they are not breached. When we succeeded in abolishing the forced labour during the season of low Nile we left this alone, partly because it would have been very difficult to find the means of paying these labourers, but chiefly because we feared that if we made this work over to an ordinary contractor and if by any chance an embankment breached and a province was flooded, which was always a danger, there would be such a rage against the whole system of contractors and free labour that the *corvée* with all its evils might be brought back again. But it is two years since I left Egypt and I believe this Nile flood *corvée* also is now being abolished.

FOUNDATIONS IN DEEP AND UNRELIABLE SOILS.

(Concluded from last week.)

I HAVE said that from faulty foundations several Canadian structures have been wrecked to a considerable extent, but I shall only here allude to the new Joliette church, from having myself seen it now two years ago, and the blame ought to be fixed somewhere for a fault which it will probably cost all of 10,000 dols. to make good. The tower of this fine edifice when I saw it had actually sunk not less than 11 inches below the adjoining masonry of the sides, tearing itself away completely from the adjoining walls or remainder of the façade; and as lateral portions of the façade had also sunk, though to a less extent, and were bringing down the side or aisle walls of the edifice, the churchwardens had the whole front of the façade cut away from the sides to allow of any future sinking of the tower without dragging the sides with it to destruction. The other churches I have mentioned as at Nicolet, St. Casimir and St. Bazile, have been affected, I am told, exactly in the same manner, and due to a similar cause, to wit, the omission on the architect's or contractor's part to so proportion the breadth of footings as to cause every square foot thereof to bear an absolutely equal load on such a soil as at Joliette, where there are some 8 feet thick of sandy clay overlying some 20 to 30 feet of mud or of clay of such a soft and semi-liquid nature that anyone can drive an iron rod into it to a depth of 20 feet or more. And this proportioning of the area of footings is such a simple thing to calculate that it is criminal, to say the least, to neglect doing it. Again, in this case of the Joliette structure, the foundation, I am told, of the tower and remainder of the front

elevation were sunk to a greater depth than those of the aisle walls, a very foolish thing to have done, as it left less of the comparatively solid upper stratum of sand between the wooden platform under the walls and the soft clay below, thus increasing the tendency of the heavier walls to penetrate into the soft substratum. Now the architect who planned the structure, it is said, disclaims all responsibility in the premises, as not having been employed to superintend the construction of the building; and the contractor says that neither is he responsible, as he executed the plans as prepared by the architect; and so between them both it appears that the parish will have to foot the bill of reconstructing the whole façade and tower at the parishioners' expense.

I had the honour at our last meeting in Quebec of reading you a paper on the "Necessity of a School of Architecture for the Province of Quebec," or I should more aptly have said, "for Canada as a whole," since similar failures have occurred in Ontario; and now I presume it will not be denied that such a school is of paramount necessity, where an aspiring architect may be taught the importance of sounding and boring the soil he plans to build on, and in any case where not on solid rock or an unyielding base, not fail to spread his footings in a way to make them truly proportional to the respective weights they will have to bear.

Errors so expensive to make good should not occur again as at St. Bazile, where the walls sank some 2 feet and the masonry had to be almost entirely rebuilt at a cost of some 12,000 dols. At Cornwall the settlement was not less than 2 feet 10 inches and occurred all at once, I am told, on or during a single night—the front wall tearing itself away from the remainder of the church and sinking bodily and equally all through, or in a way to allow of making good the levels of the doorways without the necessity of demolishing and rebuilding the front and tower.

Foundations may be considered the engineering part of architecture and it is strange and hard to see how, while an engineer will never attempt to drive a pile or sink a caisson or start the foundations of any structure without sounding the soil he has to build on, an architect can consider himself less liable to the danger of unequal settlement. The *Canadian Architect and Builder* in an article in its November issue of last year, insists on this engineering knowledge on the part of architects, and it is to be hoped that the absolute necessity of the thing will now be seen and not forgotten in the future.

Not only the settlement is to be guarded against, but

ROOFING FELT.

Selly Park
on Birmingham
26th Sept 94

Dear Sir,

If you ask my opinion, I should strongly recommend you to use 'The Potter' Roofing Felt. You know how much about felt as I do—at any rate you will then know this one—and then use felt, and felt. 'The Potter' is called after the maker, Andrew Potter, of Wolverhampton.

Yours truly,

N. P. Naylor

Mr. Charles Lethbridge

inequality of settlement in the different portions of a foundation. It is just as easy to erect a heavy structure on a mud foundation and insure its permanent verticality as to cause a heavy ironclad to ride at ease and upright on its bed of water. This can be done, as said, by thoroughly proportioning the area of base of each portion of the structure to the weight it has to bear, which will insure absolute equality of settlement in any homogeneous soil; but if one or two corners of a structure be on rock or any such unyielding foundation, then it becomes peremptory in the other portions to reach the rock or rest on it by the proxy of piles or pillars driven down to an equally unyielding bottom; or if not, to see by trial how much the soil can bear without sensible compression and divide the weight, or spread it out over such a number of feet as will meet the requirements of the case. If a reliable bottom is to be reached by piling through a bed of stiff or compact and so to say incompressible sand, it must not be forgotten that material aid can be had by applying the loosening, disintegrating power of water. I had to do this myself when boring in 1876 for the tests as to the nature and impermeability of the soil or river bed to be built on. The sand was so compact that a 2 or 3-inch tube could not be driven into it to more than a few feet without the aid of a jet of water forced down through an inner and smaller pipe, and which loosened and disintegrated the sand beneath the outer pipe in a way to cause it to sink to a depth of 70 feet to rock bottom, while room was made for the advancing pipe or pile or borer by the water forced down, as said, through the inner tube, coming up or returning through the space between the tubes and bringing up the loosened sand with it. Ordinary wooden piles may be driven in the same way through stiff and otherwise unyielding soil, by the use of water under pressure forced down through a pipe or hose attached to the side of the pile and reaching to its shoe or point, and easily removable and to be used again on each succeeding pile. This most effective mode of loosening the soil is much used and has been for some years past in pursuing excavations under water, and in fact in all possible situations, and the material removed, it must be remembered, can now, instead of having to be so removed by cartage, be blown away to any distance by forcing it through pipes of adequate size or even rubber or canvas conduits under air pressure, or which is the same thing, by pumping out the air in front or ahead of the material to be discharged or removed, when the mere atmospheric pressure of over 2,000 lbs. to the square foot blows the stuff along to its destination.

The most advanced practice in caisson foundation building is perhaps that now being pursued in putting in the piers for the American Surety Company's building in course of erection opposite Trinity Church, corner of Broadway and Pine Street, New York, by Bruce Price, architect of the new Frontenac Hotel, Quebec. These foundations are 70 feet deep to the bed rock, while the building of 22 storeys or 360 feet in height above road level, and therefore higher than Trinity Church itself, will have a total height of not less than 430 feet, its cost being put down at some 2,000,000 dols. Messrs. Soozsmith & Co. are the engineering firm of contractors. I say "engineering," because nowadays the responsibility for solidity and permanency of construction devolves on the contractors equally with the designing architect. These firms of builders employ the highest engineering talent, for it must not be believed as popularly thought that all the engineering difficulties are in advance wrought out and solved by the designers. On the contrary, Sir Benjamin Baker in the construction of the Forth bridge, where the twin spans are each some 1,700 feet from pier to pier, gives the greatest credit to the contractor's engineers for their many ingenious devices in carrying out the work. In the case under consideration—the American Surety Company's building—there are thirteen brick piers on as many rectangular steel-built caissons of $\frac{1}{2}$ -inch stuff, braced on the inside. The caisson is 7 feet high beneath the roof of heavy I beams, its sides carried up 2 feet all around above the roof, with a 2 feet filling of concrete on which the brick piers rest. The whole foundation was excavated bodily and taken out down to 20 feet beneath the roadway, at which depth water was reached. The caissons were then put in place—not all of them together, but in alternate series, so as not to risk deranging the foundations of adjoining structures, sunk to a lesser depth than that to be arrived at. To each caisson is applied a tube of oval horizontal section, and of such size, some 3 by 5 feet inside drain, in the clear of jointing flanges, as to allow of the men passing up and down to and from their work, and to give passage to the buckets, go and come, by which the excavated material is raised from within the caisson to the surface. The brickwork upon the caisson progresses as the caisson sinks gradually to destination with its increasing burden of advancing masonry. As the pier advances or is added to in weight, additional lengths of iron shaft, or well, or vertical tunnel-way are added and bolted on, air tight of course, and as the shaft gains height the air lock rises with it. The construction and use of the air lock, though presumably well

known to all, from having now so often and for so many years been used, as in the construction of piers of the Brooklyn Bridge and elsewhere, is a mere cylinder, a component portion of the shaft, high enough and of sufficient size for several men to stand in at a time. It has an under and an upper door or hatchway, through which the workers in the caisson pass up and down or to and from their work. If there were no water to contend with the simple shaft way through the pier would be sufficient, the men working under ordinary atmospheric pressure, but the water has to be kept out to allow of excavating to the required depth to reach the rock. The pressure of the incoming water is counteracted, resisted by the pressure of the air from within the caisson outward. This pressure increases with the depth, and hence the necessity of the air back, wherein, while the ingoing and outgoing gang or band are in it, the pressure of the air, by opening a cock in the floor for the ingoers, one in the roof for the outgoers, is gradually increased or diminished in a way to accommodate the lungs and give no trouble to the individual—cause him no discomfort. This would seem to be slow work, but on the contrary, it is, under the trying and difficult circumstances, very rapid, when we consider that as much as 52 feet has thus been sunk in a single week, or nearly 9 feet per diem, which would entail a delay of only thirteen weeks or a little over three months if each pier had to be sunk separately to destination, whereas three to four of the piers can proceed simultaneously and the work be done in a month or a little more.

In the manipulation of the caissons great ingenuity is shown to remove no more earth than that which is vertically under the caisson, to avoid disturbing adjacent buildings. In sinking caissons in river beds no such precautions have to be observed, and the material excavated in semi-fluid state can be blown out instead of bucketed out, as was done in the case of the Brooklyn Bridge foundations, where on one side of the river, after the caisson reaching bottom at 40 feet depth of water, there remained 40 feet of sand still to be removed to reach the rock foundation, and this immense mass of some 70 by 100 by 40 feet, say 10,000 cubic yards, was actually blown out by all pressure through the twelve 4-inch iron pipes provided for the purpose, two to each of the six compartments into which each caisson was divided, the pipes running from the floor level of the caisson through the roof thereof and up through the masonry as it progressed, with an elbow at the top of each throwing the stuff into the river. A caisson for the foundations of a building has also sometimes to be moved laterally, and

this is done and has been done effectively with its load of brick-work on it, by thrusting it forward by struts and jack-screws from the off-side, while the on-side or that to which the pier is to be moved is caused to be gradually worn away by the disintegrating action of water already alluded to, the operation being performed by jets of water under pressure, some of them from above downward, while others as effectively do their work from beneath the lower edge of the caisson upward.

PATENTS.

This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 20633. Joseph Ferriman Waters, for "An improvement in window blinds."
- 20650. Lambert Küpper, for "Improvements in gypseous walls."
- 20662. Josef Schmitz and Christian Bürker, for "Improvements in the construction of ceilings."
- 20695. Franklin Alfred Wells, for "Improvements in water-closets."
- 20736. John Gilchrist Stein, for "Improvements in kilns for firing bricks, pottery and the like."
- 20938. Robert Cooke Sayer, for "Improvements in dry closets in which heat is employed to desiccate the soil."
- 20740. Henry Wyld, for "Certain improvements in door locks and latches."
- 20744. Edward William Ives, for "An improved system and apparatus for purifying sewage, or other foul or waste waters."
- 20777. Friedrich Ferdinand Wilhelm Ludwig Müller, for "Improvements in water-closets."
- 20782. Gustav Schulze, for "Improvements in roofing tiles and in apparatus for manufacturing same."

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of *Contracts Open, Tenders, &c.*, it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 P.M. on Thursdays.

CONTRACTS OPEN.

ABERDARE.—Nov. 26.—For Building Thirty-three Houses. Mr. C. H. Elford, Architect, 34 Canon Street, Aberdare.

ABERDOVEY.—Dec. 6.—For Works of Sewerage and Water Supply. Mr. Morgan W. Davies, Engineer, 17 Adelaide Street, Swansea.

ANERLEY.—Dec. 1.—For Erection of Weather Screen at District School. Mr. H. J. Chaldecott, Clerk to Managers, North Surrey District School, Anerley.

ANERLEY.—Dec. 1.—For Making-up and Metalling about 200 Feet of Entrance Road at North Surrey District Schools. Mr. H. J. Chaldecott.

BANGOR.—Jan. 3.—For Reservoir. Mr. Francis Pollock, Town Clerk.

BELFAST.—Nov. 24.—For Extension of Covered Market and Building New Fish Market. The City Surveyor.

BOSCASTLE.—Nov. 28.—For Additions to Board Schools. Mr. Otho B. Peter, Architect, Launceston.

CAVERSWALL.—Nov. 27.—For Enlarging Board Schools. Mr. T. P. Hulse, Architect, Longton, Staffs.

CHESTERFIELD.—Nov. 24.—For Building Pair of Semi-detached Villas. Mr. W. H. Wagstaff, Architect, 57 Saltergate, Chesterfield.

CITY OF LONDON.—Nov. 23.—For Construction of New Commissioners' Office in Basinghall Street. Mr. Henry Blake, Guildhall.

CROMER.—Nov. 23.—For Retiring Room to Court House at Police Station. Mr. T. H. B. Heslop, County Surveyor, Norwich.

DONCASTER.—Nov. 29.—For Building Schools. The Borough Surveyor, 3 Priory Place, Doncaster.

DOWNPATRICK.—Nov. 24.—For Lavatories for Workhouse. Mr. J. W. Montgomery, Clerk, Poor Law Office, Downpatrick.

EAST ASHFORD.—Dec. 1.—For Execution of Works of Drainage and Sewerage. Mr. Alfred J. Burrows, F.S.I., 41 Bank Street, Ashford.

EXETER.—Nov. 30.—For Reconstructing Drains, Painting and General Repairs, Larkbeare House. Mr. E. H. Harbottle, County Surveyor, Exeter.

FAREHAM.—Nov. 23.—For Tank and Tankhouse, Water Mains, Hydrants, Sluices, &c. Mr. Walter Butler, Surveyor to the Local Board, Fareham.

FARNBOROUGH.—Dec. 1.—For Building Police Station. Mr. James Robinson, County Surveyor, 13 Southgate Street, Winchester.

FIRTH OF CLYDE.—Dec. 6.—For Construction of Pier at Ardeer, Stevenston. Messrs. Crouch & Hogg, 175 Hope Street, Glasgow.

GLASGOW.—Dec. 6.—For Supply of Granite and Whin Paving Stones, Crossings and Channels. Mr. Whyte, Master of Works, City Office, Glasgow.

GLASGOW.—Dec. 8.—For Works in Erection of Hospital for Infectious Diseases, Ruchill. The City Engineer, 64 Cochran Street, Glasgow.

HARROGATE.—Nov. 27.—For Building Retort House. Mr. George Sayner, Manager, Gasworks, Harrogate.

KINGSTON.—Dec. 1.—For Boundary Walls and Oak Fence, &c., for Burial Board. Mr. E. Carter, Surveyor, 55 Clarence Street, Kingston-on-Thames.

KINGTON.—Dec. 7.—For Erection of Girls and Infants' Schools and Mistresses' Residences. Mr. J. E. Goodacre, Dunfield, Kington.

LEICESTER.—Nov. 26.—For Constructing Shelter at Recreation Grounds. Mr. E. G. Mawbey, Borough Surveyor.

LONDON.—Nov. 26.—For Supply during 1895 of Timber English and Foreign; Ironmongery, Saddler's, Coach, Engineer's, &c.; Axles and Springs, White Lead, Glass, Grease, Indiarubber and Sundries, Coach Trimmings, Canvas, Sacks and Horsecloths, Leather, Basils, Backs, Bulls, Mill Bands, &c., Brushes and Brooms, Coal and Coke, Building Materials, Gas and Water Fittings. Mr. R. T. Kingham, London General Omnibus Company, 6 Finsbury Square, E.C.

MENSTON.—Nov. 23.—For Building Country House. Messrs. H. & E. Marten, Architects, 5 Charles Street, Bradford.

PENTRE.—Nov. 30.—For Building Infants' School. Mr. J. E. Lash, Architect, 5 Temple Row, Wrexham.

PORTREATH.—Nov. 24.—For Infants' School, &c. Mr. S. Hill, Architect, Redruth.

QUEENSBURY.—Nov. 24.—For Building Local Board Offices, Surveyor's House, Stabling, Mortuary, Fire Brigade Station, &c. Mr. John Drake, Architect, Winterbank, Queensbury.

SEELY OAK.—Dec. 11.—For Building Infirmary. Mr. D. Arkell, Architects, Temple Row West, Birmingham.

SPAIN.—Nov. 30.—For Construction of Dock (70,000l.) at San Stephen's, Provia. Plans, &c., at the Ministry, Madrid, and at Department of Public Works, Oviedo.

The largest and best variety of Fanlights and Sash Openers, &c., to suit all requirements, viz. details of work and price, to work by means of the Vertical Screw Rod and Regulator, or Cord.

SPECIALTIES—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture, Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c. &c.

ROBT. ADAMS'S Patent

Ventilating Apparatus for

Continuous Sashes of

Lantern Lights,

Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE

PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No. 203. Special thru motion room section Box suitable for v narrow still It can be in where the sp is insufficient for anything else. This is nest, strong and reliable

TRADE NOTES.

THE Unbreakable Pulley and Mill Gearing Company, Limited, have just booked an order for one of their "Gorton" patent gas engines for the planing, sawing and moulding mills of Mr. John Gray, Albion Street, Grimsby.

AN important firm of Atlantic steamship owners, who some time ago introduced the Baird-Thompson improved system of ventilation into the whole of their fleet, are so thoroughly well satisfied with the results obtained, that they are introducing it into several new ships they are at present building, and have accordingly placed the contract with Messrs. Baird, Thompson & Co., Limited, Ventilating Engineers, London and Glasgow

"SPHINX" PORTLAND CEMENT.

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 14 inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors & Street Paving.

"ECLIPSE" PORTLAND CEMENT. Quick-setting; test, 3 parts. Standard Testing Sand, 280 lbs. per square inch; 28 days. The finest, most plastic, best sand-carrying and cheapest Cement in the market.

Also adapted for laying encaustic tiles, making joints in clay pipes, internal stucco, concrete foundations, &c.

See sufficient for Practical Tests Free. Manufactured by HENBOARD & CO., Dunball, Bridgwater.

ESTABLISHED 1844.

TURAL PORTLAND AND ROMAN CEMENTS, HYDRAULIC BLUE LIME, Plaster of Paris, Keene's and Parian Cements, &c., Roofing Tiles, Drain Pipes, Paving Tiles, Bath Bricks, Railway and water communication.

with instructions to proceed with the work. This of itself speaks volumes for the efficiency of the Baird-Thompson system.

THE new Board Schools, Cardiff, are being warmed and ventilated by means of Shorland's patent Manchester stoves, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

A NEW pulpit, the gift of Lady Sykes, has just been added to the Catholic church in Spanish Place. It is designed by Mr. E. Goldie, of Kensington Square, and executed in alabaster with detached Purbeck marble shafts below the floor line. The figures of SS. Paul and John, seated under canopies, divide the body of the pulpit into three equal parts. The interior is lined with cedar and the same material forms a covering to the top of the cornice. With the exception of the metal handrail and gates by Messrs. Hart, Son & Peard, of Wych Street, W.C., the work has been carried out by Messrs. Earp & Hobbs, sculptors, of Lambeth Road, S.E. and Manchester.

WE hear that Rudolph Schwarz, of Vienna, has produced an apparatus by which even those who have never learnt to draw can draw correctly at free hand.

VARIETIES.

WE understand that the directors of the Belfast and County Down Railway Company are inviting competitive designs from architects for the proposed new hotel at Newcastle, co. Down, and offer three prizes of 100*l*., 75*l*., and 50*l*., in accordance with the respective merits, for the best designs. It is intended to expend a sum of 25,000*l*. on the hotel buildings. Mr. Alfred Waterhouse, R.A., is to act as assessor.

THE City Commission of Sewers have decided that the portion of Upper Thames Street between London Bridge and Queen Street is to be paved with Australian wood, at an estimated cost of 2,600*l*.

THE London County Council have given Parliamentary notices of intention to introduce Bills in the forthcoming session authorising them to acquire the undertakings of the eight metropolitan water companies by agreement or arbitration.

THE Dublin Corporation will seek powers next session to make further provision with reference to hoardings for advertising or other purposes, and to prohibit the erection of such hoardings against or in front of any house or private grounds

facing any street or public thoroughfare without the consent of the Corporation.

THE Mersey Docks and Harbour Board at their last meeting unanimously adopted the scheme to provide lairage accommodation for foreign cattle at Seacombe, in place of that at Birkenhead. The scheme involves a cost of 400,000*l*., and will require Parliamentary sanction.

DAMAGE amounting to 150,000*l*. was caused at Nottingham on Saturday by an outbreak of fire in the lace market. Several warehouses were destroyed, and two thousand people thrown out of employment. A curious incident is related by Mr. John Spray, one of the victims of the fire, whose books were preserved in a Milner's safe. The safe was on the second storey when the floor gave way, and was precipitated into the street. On Saturday morning the safe was discovered in its normal condition, save that it was on the bottom storey instead of the second. It had been in the heart of a fiery furnace for ten hours, but on being opened its contents were found to be undamaged.

THE Board of Trade have appointed Mr. J. Wolfe Barry, C.B., C.E., Vice-Admiral Sir George Nares and Mr. George Fosbery Lyster, C.E., to be the Commissioners to hold the inquiry directed by that Act as to the improvement of the navigation of the River Thames between Thorney Creek and the Nore lightship. The Commissioners have appointed as their secretary, Mr. R. W. P. Birch, C.E.

It is proposed to erect a hospital for infectious diseases at Thornhill. The Local Board having applied for sanction to borrow 4,000*l*. for the purpose, an inquiry has just been held by the Local Government Board.

THE Leeds Mercury says:—A meeting of the members of the art gallery sub-committee of the free public library committee was held at the Municipal Buildings, Colonel Harding in the chair. What to do with a number of the pictures presented to the committee by the late Alderman George, and which it is found impossible to hang in the Art Gallery, came up for discussion, and it was resolved to recommend the full committee that they should be given back to the family. It is possible, however, that a home for them may be found in some of the branches that exist in the outskirts of the city. The committee gratefully accepted a gift of three pictures by Mr. J. H. Barr, one of their members. They are a portrait of a gentleman, a painting of Calthorpe Oak, by Rhodes, and a seascape from the brush of Leech.

THE Barnsley Corporation are about to apply for Parliamentary powers to utilise the sources of the river Rother to construct a new waterworks near Penistone. The Rotherham Corporation will oppose the application.

THE *Glasgow Herald* says:—A gold memorial finger-ring, beautifully chased, and bearing the following inscription, "Lady Mary Boyle, died May 17, 1757," in raised letters round the outside of the hoop, has been found in a field on the farm of Marress, which is situated on the left bank of the Irvine, and within the municipal boundaries. The farm of Marress formed part of the Shewalton estate, sold a few years ago by the present Earl of Glasgow on his succession to the Earldom and the estate of Kelburn. This Lady Mary was probably a daughter of John, second Earl of Glasgow, who died at Kelburn in May 1740, and an aunt of Lord Justice-General Boyle, who was born at Irvine, and died at Shewalton on February 4, 1853, in his eightieth year. The ring would no doubt belong to some member of the Shewalton branch of the Boyle family.

THE Union Steamship Company's twin-screw Royal Mail steamer *Norman*, which left Southampton on Saturday, November 10, with the outward Cape of Good Hope and Natal mails, arrived at Madeira at 5 P.M. on Wednesday, November 14, and proceeded for Cape Town at 7 P.M. Passage three days ten hours, net steaming time. Average speed 15.6 knots per hour. Experienced very heavy weather, steaming slow for twelve hours.

At a recent meeting of the Blackburn gas committee Mr. E. Matthew Lacey was appointed consulting electrical engineer to the Corporation during the erection of the electric lighting installation.

At a meeting of the cement trade held at the London Chamber of Commerce on Tuesday, the 20th inst., it was resolved "That a committee be appointed, with power to engage experts, to investigate into the question of the admixture of Kentish rag stone, other stone or other material with Portland cement so far as carried on at home and on the Continent, and to report and advise thereon. Representatives of the following firms have been appointed upon the committee:—Barron & Co; Burnham Cement Company; Francis & Co., Limited; Gibbs & Co.; Hilton, Anderson, Brooks & Co.; J. C. Johnson & Co.; Lee, Son & Co.; London Portland Cement Company; Tunnel Cement Company; J. B. White & Bros.; and Wouldham Cement Company.

BUILDING AND BUILDERS.

At the meeting of the Edinburgh Dean of Guild Court, a warrant was granted to the Rev. H. J. Wotherspoon for a new hall at Montpelier, which is to take the place for a time of the present iron structure used by the congregation of St. Mark's Church, Morningside. It is intended to build a new church altogether on a spot closely adjoining the hall. The latter building is, however, to be constructed in the form of a church, with a chancel and the usual vestry and organ accommodation. It will be 70 feet long by 31 feet wide, and will seat about four hundred people. The style will be early English, and the building will be constructed of Hailes stone rubble, with red Dumfries stone dressings. It will have an open timber roof with hammer beams and collar beam. The architect is Mr. Henry Kerr, 36 Hanover Street.

At the Dean of Guild Court, Leith, warrants were granted to A. & B. Sutherland to build four semi-detached villas at Rosebank Road, and to the Leith School Board to erect a new swimming bath in connection with Great Junction Street School.

THE complete restoration of Morland Church, near Penrith, is to be undertaken at a cost of nearly 1,500*l.*, exclusive of porch and chancel. The edifice is one of the oldest in the North of England. The Ecclesiastical Commissioners, who are the patrons of the living, have undertaken to restore the chancel, and the porch will be repaired at the cost of Mrs. Markham, Morland House.

PLANS have been prepared by Mr. Sheppard, architect, for increased school accommodation at Droitwich, to be provided by voluntary donations.

THE directors of the Queen's Hotel, Hastings, have just carried out a scheme of decoration and refurnishing. In all, nearly 6,500*l.* has been spent upon the work, and as the hotel possesses a big frontage and occupies an extensive area, the management is now able to offer abundant accommodation to visitors. The whole work of renovation, &c., has been carried out under the superintendence of Mr. Arthur Wells.

THE old parish church of Charlton has been ordered by a faculty to be demolished for the purposes of Corporation improvements at Dover. The site has been occupied by Christian churches for nearly a thousand years, although the present edifice was only erected during the present century.

NOTES ON NOVELTIES.

AN interesting private demonstration of the capabilities of the Burke automatic wood-turning machine was recently given at 40 and 41 Kirby Street, Hatton Garden, where the machine can now be seen by those interested in the building, cabinet-making and kindred trades. It ably vindicates the character claimed for it by its inventor, Mr. H. J. Burke, turning, as it does, newel posts, porch-columns, balusters, chair and table legs, billiard-table legs, columns and pilasters for cabinet-work, &c. These can, with equal facility, be produced round, square, octagonal, hexagonal or pentagonal, or, say, one-half round and one-half square, concave or convex, in any design or style, and leaving the machine quite finished, thus dispensing with sandpapering or any hand work whatever. A striking feature of the machine is the speed with which it operates; no less than eighty square baluster rails can, for instance, be produced in an hour, irrespective of the elaborateness of the design. Hard woods, such as oak, box or ebony, are as easily manipulated as those of the softest grain, and in fact give, if possible, a better result, as the details work up sharper, and knotty wood gives no more trouble than the cleanest. The machine is practically automatic, and having very few parts, costs very little for maintenance, therefore the work, despite its excellence, can be produced at a very low price. As an instance, in turning an ordinary newel square or octagon, 5 feet long by 6 inches square, in this machine, the cost would not exceed 3*d.*, and a similar article could not be turned by the ordinary methods for less than 1*os.* or 15*s.* Patents are already acquired, or are in course of being acquired, in all countries by the Automatic Turnery Patents Company, Limited, whose prospectus will shortly be issued.

THE SURVEYORS' INSTITUTION.

THE following members, having passed the requisite qualifying examination, have been transferred during the recess from the class of "Professional Associates" to that of "Fellows" of the Institution, viz. :—

Septimus Beven, 56 King Edward Road, Hackney, N.E.; Sidney Crawford Buckland, Windsor, Berks; David Thomas Davies, 11 Serle Street, Lincoln's Inn, W.C.; Herbert Archibald Finn, Sole Street House, near Faversham, Kent; Richard Percival Morris, 44 Inderwick Road, Stroud Green, N.; Samuel Frank Newman, 33 and 34 Savile Row, W.; Christopher Percival Oakley, 10 Waterloo Place, S.W.; James Pain, St. Mary's Street, Ely, Cambridgeshire; Edward John Partridge,

7 Crumpsall Villas, Selwyn Court, Richmond, Surrey; Henry Herbert Robinson, 8 Oxford Mansions, Oxford Circus, W.; John Dougal Roney-Dougal, Northampton; Ernest Allen Stapledon, Bridge Chambers, Bideford, North Devon; Samuel Clifford Tee, 86 Grosvenor Road, Highbury New Park, N.; Frederick Wilson Temple, 27 Sandgate Road, Folkestone, Kent.

FIRES IN THEATRES.*

BEFORE discussing the precautions necessary for prevention, let us inquire briefly into the chief causes of theatre fires and calamities. This study of the causes leading to fires and panics is of the utmost importance, because it enables us to derive therefrom the best practical lessons as to what to do, and what to avoid, to prevent the occurrence of a disaster.

Dr. Choquet, in discussing the causes of theatre fires, divides them into two principal groups, viz. (1) the intentional causes, or incendiarism, and (2) the accidental causes.

Leaving incendiarism from malice or other reason out of consideration, we can distinguish further between :—1. Exterior causes, such as lightning, exposure, dangerous trades carried on in the vicinity of a theatre, bombardment of the city, or riots. 2. Interior causes, viz. (a) on the stage, (b) in the auditorium, (c) in other parts of the house. 3. Mixed causes, such as fires originating in living apartments or in stores, or offices or restaurants under the same roof with the theatre proper. Placed in the order of their frequency, we find theatre fires to have their origin :—

1. On the stage. 2. In the actors' dressing-rooms, in the engine, and boiler-room, in the cellar and in the administrative offices. 3. In stores, offices, living apartments or restaurant kitchens in the theatre. 4. In the auditorium. 5. In outside causes, such as exposure to neighbouring buildings on fire.

In not a few cases the exact cause of a theatre fire remains for ever unknown. This is due largely to the rapidity with which the flames spread among the vast mass of combustible material and to the haste and confusion incident to the fire, particularly when this breaks out during the night time. The best information about causes of theatre fires is derived from those fires which break out during a performance, and which for obvious reasons are the most dangerous and often lead to deplorable calamities.

LEMENT

The majority of fires during performances break out on the stage, and are due to open and unprotected or to deficiently protected lights in too close proximity to or amid a mass of unprotected and highly inflammable scenery, draperies, gauze, ropes and woodwork. Among the numerous other causes I mention the careless lighting of gas lights on the stage by alcohol lamps on long poles, and sometimes defects in the electric spark or flashlight apparatus, causing escapes of gas or gas explosions; carelessness in the use of lamps on the stage or in the dressing-rooms, or exposure of lamps to sudden draughts; careless handling of candle lights in dressing-rooms; alcohol lamps used by actresses for heating hair curling irons in the dressing-rooms; the dropping of sparks from the lighting torches on the stage, or on decorations or papers; temporary gas conduits needed on the stage, generally consisting of rubber tubing, becoming leaky, or not being well jointed together, or becoming otherwise damaged and defective; the use of portable open gas burners near movable scenery; the use of defective gas burners and gas fittings, exposed gas pipes damaged by the shifting or carrying about of heavy pieces of scenery or furniture; main gas pipes becoming leaky and causing escapes of gas; gas explosions in the gasmeter vault or elsewhere; swinging gas brackets setting woodwork or scenery or curtains on fire. Lights other than gas lights are often worse; the upsetting of coal, oil or kerosene lamps, and the explosion of such lamps are fruitful causes of fire.

The electric light finally, although the safest comparatively of all lights, may cause fire by reason of electric-light wires not being properly insulated or being faultily installed.

The careless use of matches, other than safety matches, throwing away of lighted matches, and rats or mice gnawing phosphorus matches in hidden recesses, are among the causes of fires.

The smoking of tobacco, cigars, cigarettes as well as pipes, and the careless throwing away of lighted cigars or cigarettes in dressing-rooms or on the stage or in the sub-basement, the careless use of the oxyhydrogen or limelight, the use of fire-works in spectacular plays calculated to attract the public, the use of red fires, torches, Roman candles, the firing of rockets, are dangerous causes of fire, because a spark often lodges amid scenery, and the flames break out during the night following the performance. Sometimes fire-works are prepared for the play in the theatre building, which is a pernicious practice. The representation of fire or conflagrations or actual explosions in the course

of the play, the firing of firearms, pistols or guns, with paper wads; the careless handling and use of benzine or turpentine in workshops and costume-rooms. The heating apparatus, particularly stoves and furnaces when overheated during extreme cold weather, defective flues, timber near woodwork; floor registers and heat flues, hot ashes, the use of straw or hay on the stage, the careless use of soldering furnaces on tin theatre roofs, gauze dresses of ballet dancers catching fire and in turn setting decorations on fire, non-removal of rubbish and trade refuse; and accumulation of large masses of combustible material, woodwork, canvas, gauze, pasteboard, hemp ropes, paper with varnish, so-called properties, &c., on the stage; the use of rooms in the theatre, in the basement, or in the loft over the auditorium, or even of the stage, as paint or carpenter's shop; the spontaneous combustion of heaps of waste material of oily rags used for cleaning lamps, or in engine or dynamo room; the action of rays of the sun concentrated by window-glass or lenses; carelessness in the necessary quick moving or shifting of inflammable scenery near the innumerable gas-lights; the drying up of woodwork on the stage by the heat due to the numerous lights.

As indirect causes of fire, I may lastly mention an undesirable site, the danger from contiguous or adjacent houses and property, the bad arrangement of the plan, the use of bad materials in construction, defective general system of construction without division into separate fire risks; the misuse of a part of the premises, as living or sleeping apartments, as kitchens for restaurants, or for dangerous trades or stores; the want of proper fire appliances and of a fire watch; the absence of fire alarm telegraphs, or delays in sending the alarm; frequent changes of watchmen, fire watch and stage hands, and the fact that even men occupying responsible positions grow careless after long time.

The danger of fire in a theatre is also, to some extent, dependent upon the character of the play, whether the plain comedy or drama, or the more elaborate opera, ballet or spectacular play; the arrangement and size of the stage, the method of lighting used (incandescent electric lights being without doubt the safest to use), and the age of the building, the first five years being, as found by experience, among the most dangerous.

Causes of Panics.

Panics may occur in any place of assembly where large crowds of people are congregated, even when there is no out-

63 FOLE STREET, LONDON, E.C. Branches at Manchester, Leeds, Bristol and Glasgow.

break of fire, and sometimes very trifling causes may create terrible panics. It is in many respects much more difficult to prevent a panic in a theatre than a fire, and, what is worse, panics may become quite as dangerous in fireproof buildings as in those of a combustible nature.

The immediate causes of a panic may be a sudden outbreak of fire; a false cry of "Fire!" the false alarm being given either by some excited or frightened, foolish person in the audience, or sometimes intentionally, as, for instance, by pickpockets; a sudden commotion on the stage or in the audience; the sudden appearance of smoke on the stage from burnt fireworks or otherwise; the unannounced darkening of the house; a sudden extra pressure of gas at the footlights, causing the flames to flare up unduly; the sudden extinguishment of the electric light; a fire alarm in the neighbourhood, or even only the rattling noise of passing fire-engines; the reflection of a fire in the neighbourhood of the theatre; a thunderstorm or stroke of lightning; persons fainting in the theatre; horses on the stage becoming frightened and shying, or falling into the orchestra pit, and others.

Features in the construction and arrangement of a theatre which may indirectly lead to a panic are too few exits, various exit passages crossing each other, obstructed aisles or corridors, too narrow stairs, winding stairs, doors opening inward, doors opening in dark corridors and safety exits kept under lock and key.

The best way to prevent panics is to give to the theatre-goers a feeling of security by planning a very ample number of wide exits, so as to enable the quick and quiet emptying of the house, by arranging easy stairs, by providing at least two separate stairs for each of the tiers, by arranging a larger number of stairs for the visitors in the gallery, by installing the electric light in the theatre, particularly on the stage, and providing also auxiliary lights in the corridors, stairs and exits.

Furthermore, by making it known to the theatre-goers that safety appliances are provided in abundance, chief among these being large stage ventilators, a fireproof curtain, fire walls dividing the stage and the auditorium, the fireproof treatment of scenery and of woodwork on the stage, also the putting up and keeping in readiness for instant use in an emergency of plenty of fire-extinguishing and life-saving appliances, including an automatic sprinkler system on the stage, which must be kept in good working order. Finally, by informing the public that a strict fire watch is kept, that the theatre is frequently inspected,

and by issuing and publishing stringent regulations referring to theatre management.

Dangerous to Human Life.

To further understand correctly the subject of theatre-fire catastrophes, let us consider briefly the various ways in which human life is endangered in a theatre fire or panic.

At the outset I will state that it is an error to suppose that the flames are the chief cause of death in theatre-fire catastrophes. The lessons of all theatre calamities point to the fact that it is not the fire, but the smoke, the fire gases and the intense heat incident to the fire, and, on the other hand, the mad rush in a panic, which kill most people. Indeed, the majority of people, particularly in the upper galleries, are suffocated or trampled to death before the fire reaches them. In many of the theatre conflagrations the bodies of victims were found perfectly intact, and either in a sitting position or else fallen upon the floor dead, without the flames ever having reached them.

The lives of people in theatres, whether spectators, actors, musicians, chorus singers, ballet girls or stage hands, are, therefore, endangered:—

(1) By smoke, fire gases, heat, asphyxia, exhaustion; (2) by fire burns; (3) by jams, knocking over, falling down stairs, trampling, crush; (4) by direct shock or fright; (5) by accidents, such as the falling of the central chandelier.

These various causes may result in (a) almost instantaneous death; (b) mortal injuries; (c) injuries resulting in permanent bodily disablement; (d) temporary illness and recovery.

The long list of theatres destroyed by fires breaking out during a performance and the numerous instances of fires breaking out during these hours, but which are put out before spreading, are proof sufficient that the dangers spoken of are constantly threatening the theatre-going public.

To sum up, chief among the causes to which serious calamities are due are open lights and inflammable scenery; defects in gas lighting and gas piping; defective gas lamps; faulty construction of the building, deficient exits and absence of a fireproof curtain, or where same is provided, curtain not used or out of order, absence of fire-extinguishing appliances or lack of water under fire pressure; auxiliary lights in corridors, exits and stairs not provided, absence of smoke ventilator over the stage, accumulation of inflammable scenery and bad management in the theatre.

(To be continued.)

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.	SIEMENS' BURNERS, 23 calories per candle per hour.
ARGAND " 44 " " " " " " " " " " " "	WELSBACH " 10 " " " " " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

INSTITUTION OF JUNIOR ENGINEERS.

THE opening meeting of the fourteenth session of the Institution of Junior Engineers was held at the Westminster Palace Hotel. The retiring president, Mr. John Wolfe Barry, C.B., the engineer of the Tower Bridge, took the chair. His successor, Mr. Alexander Siemens, M.Inst.C.E., delivered a presidential address. In the course of this he said that few works of any importance could be carried out by the civil engineer without circumstances occurring which compelled him to exercise his ingenuity in suitably modifying his methods. Another factor which operated in a similar way was the constant development of new requirements in the course of the progress of civilisation. Every novelty introduced brought in its train a fresh set of requirements, which made a demand on the resources and the versatility of the engineering mind. Those problems constituted, in fact, one of the principal attractions of the engineering profession, and, in his opinion, entitled it to be considered as the profession most in keeping with the injunction that man should make nature subservient to him. When they looked round, and saw how the civil engineer had transformed the conditions of living during the last hundred years, they could not help being impressed with the change that had been brought about, and nothing was more natural than the thought that a further development of resources and an increased command over natural forces were in store for them and only waited for the right man to reveal them to mankind. Generally they might say that in order to approach a problem with the most certain prospect of success,

it was necessary (1) to define as accurately as possible the want that existed, or the particular object that was to be attained; (2) to be well acquainted with the scientific principles which came into play; (3) to know how the want was met, or the object attained in practical life; (4) to find out what proposals had been made by others in the same or in a similar case. A careful attention to these requirements would prevent much disappointment and waste of energy. His object that night was not to hold up to ridicule the endeavours of people who might be mistaken, who worked hard enough and earnestly enough in many instances to deserve a better fate, but to impress upon his hearers the necessity of making themselves thoroughly acquainted both with natural laws and existing practice.

SOCIETY OF ARTS.

THE opening address of the session of this society was delivered by Sir John Donnelly, who in the course of an exhaustive review of the past work of the Society dealt with the educational influence exercised by it upon technical education in this country. Interesting reminiscences were given of famous men who had been connected with the Society in its early years. Goldsmith was an unsuccessful candidate for the secretaryship, and the only speech Dr. Johnson is said to have made on his legs was delivered in the meeting-room of the Society. The lecturer described some of the figures in Barry's fine frescoes which adorn the walls of the theatre, pointing out that in the one representing "The Thames" the portraits included those of the Earl of Chatham (representing Neptune), Drake and Captain Cook. Dealing, in conclusion, with the Technical Instruction Act, he said that for the year 1893-94 a total of almost exactly 626,000*l.* was provided in England alone for technical instruction, independent of the grant from the Science and Arts Department. That showed that the operations of the Science and Art Department, the Society of Arts, the City and Guilds of London Institute, and other bodies which had previously been engaged in the movement had not been unfruitful. But unquestionably a great danger lurked around a sudden outburst of zeal of this kind. How far had

the public generally been convinced of the efficacy of science and art and technical instruction, and the advantage of spending all this money on it rather than in relief of rates? How soon would the pendulum of public opinion, which had been so suddenly and so severely forced in one direction, swing back again? Or—a still greater danger—how soon would the critic, the cynic, and the “practical” man commence their innings by asking to have the account balanced and the profit shown? There were constantly violent fluctuations of opinion on the subject. Every now and then was heard a great outcry against the Royal Academy and its schools or South Kensington and its “system.” And if South Kensington now, why not, in a few years hence, the technical schools and courses of instruction which were being set up with so much care and thought in all parts of the country? He was sure this danger was already felt by many who were interested in technical instruction. The Science and Art Department could always point to the fact that if its science teaching was wrong, it erred in good company, for the syllabuses were prepared and the examinations were conducted by some of the most eminent men of science of the day. If its art training was wrong, it was that which had been laid down by some of the most accomplished artists of the day: it was watched and reported on by such from year to year, and the so-called “system” was, for the matter of that, no invention of South Kensington, but the plan on which artists had been taught their trade from time immemorial. But to whom could the local authorities under the Technical Instruction Act appeal? It seemed to him that, for their own satisfaction and for the future stability of technical instruction, they would desire, instead of remaining as it were isolated and self-contained, to have an influential examining and inspecting board, to which they might refer, if they found it desirable, for assistance and advice. There were at present several bodies partially covering the ground, but only partially, and there was the great disadvantage of a want of unity. This was not the moment to bring forward any detailed scheme. He desired now simply to throw out the suggestion that the Society of Arts, which was at present covering part of the field, should take the initiative in bringing all these bodies together, so that they might form some kind of joint board, or at least co-operate.

The medals awarded for papers read during the previous session were then distributed, and a vote of thanks, moved by Sir R. Webster, Q.C., M.P., and seconded by Sir H. Doulton, was unanimously accorded to Sir John Donnelly for his paper.

BIRKENHEAD BY-LAWS.

SEVERAL cases of infringing the building by-laws were heard recently at the Birkenhead Police Court. Messrs. Jones & Bancroft, 104 Oxtou Road, Birkenhead, had built two houses in Rockybank Road, Higher Tranmere, for which the borough surveyor refused to give certificates of habitation because the bath-rooms were only 8 feet 2 inches in height, instead of 8 feet 6 inches, as provided in the Birkenhead Corporation Acts of 1881 and 1884. The builders appealed against this refusal of the surveyor, and the Corporation summoned the builders of the houses for having let them without first obtaining the certificate. The fact of the bath-rooms being under 8 feet 6 inches was admitted, and the contention of Mr. Knowles for the defendants was that a bath-room was not a “living room,” but the Bench decided against him on the point. He then pleaded, and it was admitted by the Corporation representatives, that ever since the passing of the Act the Corporation had permitted the building of bath-rooms under 8 feet 6 inches, even to as low as 6 feet. Up to the present case not a single complaint or warning had been made against this practice, and in the present instance the Corporation building officials had had every opportunity of measuring the bath-rooms, but had not done anything until the houses were roofed and completed. Mr. Knowles contended that this was a great hardship and unfair to the builders, who had given the Corporation every facility for seeing the rooms for two or three months past. The Bench held that an offence had been committed, and dismissed the appeal. Mr. Jackson said he thought the conduct of the Corporation was scarcely creditable. They had for thirteen years allowed a certain practice to prevail without questioning in any way in the hundreds of houses built, and now they suddenly came down upon these people who had already built their own houses in the same fashion. The Corporation had had every opportunity of measuring the rooms, but had failed to avail themselves of it. The proper method would have been to wait until plans were submitted for new houses, and then give notice to the builders that they were going to enforce the rule which they had hitherto not observed. Mr. Knowles thanked his worship for that expression, which he said he had himself this week conveyed to the road improvement committee in a letter. In each of the two summonses defendants were fined 1s. including costs,

USK PRIORY, MONMOUTH.

THE interesting old house known as the Priory, Usk, has just been considerably enlarged by the addition of a new wing comprising a large smoking-room with garden entrance, servants' hall and staircase on the ground floor, and additional bedrooms and bath-room on the first floor. The new buildings are domestic Gothic in the Tudor style, stone built and the roof covered with stone shingles obtained from old roofs; the dressings are in St. Aldhelm Box ground stone. The smoking-room is of fine proportions, the ceiling boarded in oak and divided into panels with heavily moulded ribs; an oak panelled dado with handsomely moulded skirting and capping is run around the room and there is a large bay window also ceiled and panelled in oak; the whole of the joinery in this room as well as the floor is in oak, and the fireplace is in character, lined with Godwin's tiles, having a beautiful red forest stone moulded margin and arch, and a large panelled moulded and carved oak mantelpiece. The curious old corridor has also been restored, the "whitewash" cleaned off the old oak beams, the ceiling and dado lined with oak, a handsome oak screen put in between the entrance hall and corridor, and the windows reglazed with lead lights of appropriate character. The whole of the works, including all the oak woodwork, have been carried out in an excellent manner by Messrs. Knox & Wells, contractors, Cardiff, to the designs and under the superintendence of the architects, Messrs. Veall & Sant, of Cardiff, who have supplied full size details for all stonework and joinery. The lead-lights and casements throughout have been supplied by Mr. S. Evans, West Smethwick, the ornamental door furniture and ironmongery by Messrs. T. Brawn & Co., Birmingham; the tiles by Godwin & Sons, Lugwardine Works, Hereford; the grates and electric bells by Messrs. J. Williams & Sons, Cardiff, and the carving both of stone and oak has been most artistically executed by Mr. W. H. Wormleighton, also of Cardiff.

admitted loss, even without charging anything for interest on capital, or making any allowance for depreciation in value of plant and machinery. The tone of the committee's report is apologetic, and properly so. The Chairman of the County Council in his annual address said, in reference to the report of the works committee:—"With regard to the quality of the work done, there are few persons to complain of it. With regard to the cost of such work, some people think that there is more to be said. But are we, as a public body, unwilling to put anything to the credit of quality? Or do we take this position—that while insisting upon quality, we at the same time insist upon cheapness? Now, it seems to me impossible to gain both ends." Of course it is impossible. Every man of business knew that, when members of the County Council were loudly boasting that they were going to oust the contractor, and save his profit of 30 to 50 per cent. But it was in order to effect that saving, and at the same time to pay a high rate of wages, that the works department of the London County Council was established. But, meanwhile, let the public and the ratepayers fully understand this: that while there is absolutely nothing to show that the work has been better done, it is equally certain that it has cost more than if it had been let by contract. The committee report that twenty-eight works completed, or practically completed, during the year ended March 31, 1894, cost 63,046*l*. Twenty-seven of these works cost 54,995*l*, and the "corrected total of estimate" of their cost was 53,370*l*. What was the original estimate is not stated, but it was probably a good deal less. If the work had been let by contract it would most likely have been carried out, taking one job with another, at about 7½ per cent. less than the estimate. The work which the committee did let by contract gave this result, so that it may safely be assumed that these twenty-seven works cost fully 15 per cent. more than the same works, equally well done, would have cost if let by contract. If proper charges were made for interest on the capital employed, and proper allowances for depreciation of plant and machinery, the difference would, of course, be greater. The one work which does show, apparently, a very large saving on the estimate is the Hackney to Holloway storm-relief sewer, which cost 8,050*l*, as against an estimated cost of 12,673*l*. The committee's report does not explain how the great difference in this case is to be accounted for. The New Cross fire station, on the other hand, cost 18,785*l*, whereas the estimate was 15,802*l*.

The estimated cost of the whole twenty-eight works was

THE COUNTY COUNCIL WORKS COMMITTEE.

WORKS, ROTHERHAM. Estab. 1854.

66,143 $\frac{1}{2}$., and the cost entered against them of 63,046 $\frac{1}{2}$., is something less than 5 per cent. under the estimate. If it had been let by contract the amount expended would, as I have said, probably have been 7 $\frac{1}{2}$ per cent. less than the estimate. But in order to carry out these works and those now in hand, nearly 100,000 $\frac{1}{2}$ of the ratepayers' capital has already been put into the business, and it appears to be intended largely to add to this amount. The site of a wharf has been bought for 39,000 $\frac{1}{2}$., and new workshops, stables and offices are to be completed in nine or twelve months' time, at a cost of which the estimate is not given, but it may be assumed that it will not be less than 20,000 $\frac{1}{2}$., as the foundations alone of the new workshops at the central works are to cost 2,000 $\frac{1}{2}$.. A sum of 20,425 $\frac{1}{2}$ has been expended on plant and machinery, and the stock of materials on hand is taken at 37,166 $\frac{1}{2}$., of which no less than 30,529 $\frac{1}{2}$ is put down as the value of the timber in store. The total sum spent by the works committee up to March 31, 1894, amounted to 206,393 $\frac{1}{2}$.. The average number of workmen employed during the last six months was 1,600 and the amount paid in wages to workmen during the year was 79,704 $\frac{1}{2}$.. With regard to the workmen, the Chairman of the County Council, in his annual address, made significant remarks. "The one danger," he said, "and probably the only danger, which the works committee has to fear—apart from captious criticism, which it can safely refute—is that the workman may not be disposed to do as good work for the Council as for a contractor. . . . It is not improbable that out of 1,700 workmen there may be some who imagine themselves very clever in gaining a temporary advantage by the course I have suggested . . . and I am not quite sure that we have a right to expect from men with 2 $\frac{1}{2}$ or 3 $\frac{1}{2}$ a week a standard that we fail to find in a class with many more advantages." From these remarks it may be gathered that the teaching of the Progressive majority of the County Council has had its effect. It is not cause for surprise if the notion has become widespread among working men that, to get employment at high wages under the County Council, the first requisite is to stand in with the party in power, by promising to "vote Progressive," and that, if only this is done, a man may best advance the great principle of shortening hours of labour by putting in as little work as possible. The less work he does, of course the more men will be wanted.

It would be interesting to examine the accounts of the County Council works committee and to compare the statements of what is called "actual cost" with the original and corrected

estimates. Obviously, for any purpose of fair comparison with work let by contract, interest on the large amount of capital employed and allowances for depreciation of plant and machinery, ought to be charged. Moreover, there appears to be some doubt whether working expenses have been properly debited. The committee's report is "that the debit for establishment charges will now be 7 $\frac{1}{2}$ per cent., as fixed by the Council, but it may have to be modified from time to time, to balance the actual outgoings." The establishment charges last year were at the rate of 9 $\frac{1}{2}$ per cent. The committee admits that "the price at which work can be done by the County Council must always remain a great controlling factor in determining as to whether a work should be let out to contractors; but the committee feel that the quality of the work must be at least of equal importance to the price." Of course it must; but I repeat that there is nothing to show that the quality of the work done by the committee has been better than if it had been done by contractors, and it has certainly cost more.

REGISTRATION OF PLUMBERS.

DR. VACHER presided at a meeting of the Liverpool District Council, at which it was arranged that a number of certificates of registration should be issued at the next meeting. After discussion it was resolved that the Secretary apply to the water and health committee of the Liverpool Corporation to receive a deputation on the subject of printing the lists of authorised plumbers issued by the Corporation, so that the public may recognise the plumbers who are registered by the Worshipful Company of Plumbers, London. It was reported that arrangements had been made to hold an examination for registration on December 1 next at the University College, Liverpool.

A meeting of the Bristol Local District Council was held at the Merchant Venturers' College under the presidency of Professor Wertheimer, B.Sc., B.A. There was a fair attendance of members from Bristol and Bath. The Secretary reported the receipt of twenty-eight handsomely-bound textbooks on plumbers' work and kindred science subjects from the Worshipful Company of Plumbers, to form the nucleus of a library in connection with the local plumbing classes. It was agreed to arrange a Conference of Councils to be held in this city early in February of next year and to include, if possible, representatives from the Birmingham, Cardiff, Portsmouth,

THE WELL-KNOWN FRIEZE, ENTITLED "THE CORN FIELD."

1. PLOUGHING; 2. HARROWING; 3. MOWING; 4. CARTING; 5. THE PRODUCTS OF THE CORN FIELD.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

A Splendid Example of Colour-Work in Permanent Ink Photo,
BY M. PAUL ALBERT BAUDOIN.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—*The Lady's Pictorial*.
"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage*.
"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—*The Gentlewoman*.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

Plymouth and Swansea Councils, at which the registration system in its relation to the public health will be discussed. The Council received with regret the resignation of Mr. Walter H. Perry as honorary secretary, a position which he has held since the formation of the Council, consequent upon his leaving Bristol to take an official appointment in the health department of the London County Council.

The annual public meeting of Leinster and Connaught District Council was held at Dublin, under the presidency of Mr. D. P. Curtis. The following elections to the District Council for the current year took place:—*Master Plumbers*.—Messrs. W. Baird, L. Brannigan, D. P. Curtis, P. Cooney, P. Dowd, J. Kennedy, W. A. Kelly, T. M. Little, W. B. Morgan, H. M'Nally, J. M'Manus, P. M'Donald, T. M'Lachlan, J. Ring, P. Rydall and T. Watt. *Operative Plumbers*.—Messrs. J. Ballantyne, T. Bedford, T. Baird, A. Bowie, J. Crawford, E. Dunne, R. Doyle, H. Fegan, R. Henderson, J. J. Leech, C. M'Kenzie, A. M'Keown, J. Manzie, A. O'Brien, T. Richardson and W. C. Walsh, the public representatives being elected triennially. The hon. treasurer read the statement of accounts for 1894, which showed a balance in hand to the credit of the District Council. A vote of thanks was tendered to Mr. W. Kaye Parry, M.A., for his valuable services as hon. secretary to the District Council during the past year. The new Council will meet early in December for dealing with applications for registration and making arrangements for examinations.

BUILDERS' BENEVOLENT INSTITUTION.

THE forty-seventh annual dinner in aid of the funds of this Institution was held on Thursday, November 15, at Carpenters' Hall, London Wall. Mr. Basil P. Ellis, the president of the Institution, occupied the chair, and was supported by Sir J. Whittaker Ellis, Bart.; Mr. John Aird, M.P.; Mr. Thomas Blashill, F.R.I.B.A.; Mr. N. Smith (master of the Carpenters' Company), Mr. A. Lucas, Mr. F. J. Dove, Mr. J. Randall, Sir W. Pearson, Bart.; Mr. B. E. Nightingale, Mr. H. H. Bartlett, Mr. Howard Colls, Mr. C. Russell, Mr. J. T. Bolding, Mr. J. W. Duffield, Mr. T. Stirling, Mr. W. Shepherd and Mr. T. Hall.

The Chairman gave the toast of "Her Majesty the Queen, the Prince and Princess of Wales, and the rest of the Royal Family."

Sir J. Whittaker Ellis, Bart., gave "The Army, Navy and Auxiliary Forces," Major Brutton responding for the Army and Navy, and Mr. J. T. Bolding (late Middlesex Yeomanry) for the Auxiliary Forces.

Sir W. Pearson, Bart., proposed "The Houses of Parliament," which was replied to by Mr. John Aird, M.P.

The Chairman, in proposing the toast of the evening, "Success to the Builders' Benevolent Institution," said it had now been established for nearly half a century, and there was no doubt that during that long period much good had been done by the charity. At the present time the Institution paid pensions to forty-eight persons, all of whom, in consequence of old age or infirmity, were unable to earn their own living. The committee made very careful inquiries before placing anyone on the list for election, and went personally into all these matters. To enable the committee to pay the pensions, an income of certainly not less than 2,000*l.* a year was required. The investments yielded about 650*l.* a year, which was a great help, but still it would be seen from these figures that a considerable part of the income was derived from annual subscriptions and donations. It was generally admitted at the present time that the building trade was depressed, and for that reason, he was sorry to say, some portions of the income of the charity had fallen off, but he hoped with the hearty assistance they had received from all quarters, and which he gratefully desired to acknowledge in the name of the committee, they would manage, notwithstanding their difficulties, to maintain the Institution on a thoroughly satisfactory financial basis. The charity was very carefully managed, they did not run into debt and ask their friends to help them out of the difficulty, but they endeavoured to keep within their income. The trade of a master builder was subject to even greater risks than most trades were. A great item to be considered in making a contract was the question of how much the labour was to cost. It was not generally difficult to state pretty nearly what the material would cost, but the labour was a very open question. He believed those who were his elders would admit that it was more difficult than it was twenty years ago to make an estimate as to what the labour would cost in any particular contract. There was all the more reason then why the Institution should be well supported. Builders might be well up to their work, but through circumstances over which they had no control, it happened from time to time that they lost a great deal of money. As in other trades, the elder men were gradually going out of business and younger men coming in, and he hoped they would do all they could to get the younger men to subscribe to the Institution.

Mr. F. J. Dove, who replied, said he had been asked to do so in the regretted absence of Mr. Plucknett, one of the staunchest friends of the charity. Builders nowadays were so keenly alive to cutting one another's throats that it was a wonder they were not all applicants for the benefits of the Institution.

The President also gave the toast of "The Worshipful Company of Carpenters," to whom they were indebted for the use of the hall in which they were met, and for their handsome donations to the funds.

The Master of the Carpenters' Company replied, and said that the Company took a great deal of interest in this Institution. The company had been deprived of a great many of its old functions, but they were doing their best to promote technical education.

Mr. Howard Colls proposed "The President." Speaking as an ordinary builder, he felt proud they had in the chair that evening a man who really belonged to the higher grade of the trade. The toast was very cordially received, and the Chairman replied.

Mr. H. H. Bartlett gave "The Architects and Surveyors." From remote antiquity arch tecture had been one continued progress onwards and upwards and they could point to works of the present time as being fit to compare with those of the past. The architect's profession was not altogether an easy one. Builders came very much into contact with them, and from his own experience he had nothing to complain of as regards architects generally. The duties of architects and surveyors should be kept separate. The builders were perfectly satisfied with the way in which the London surveyors

conducted their work, holding the balance as they did between the architect and the builder.

Mr. Thomas Blashill, F.R.I.B.A., in replying for "The Architects," said that one very important point in connection with the technical education of the young architect, as laid down by their Institute, was the way in which he should conduct himself towards the builder and his clients. He agreed that the duties of the surveyor were not such as should be undertaken by the architect.

Mr. H. Northcroft said he felt that the quantity surveyors of London were getting into a better position year by year. He believed they were becoming recognised in a greater degree than before, and as the profession grew in importance, London quantities would be used all through the kingdom, the London practice being undoubtedly the best.

Mr. Arthur Lucas proposed "The Vice-Presidents, Committee and Stewards." He bore testimony to the good work done by those gentlemen, and to the exertions of Major Bruton, their energetic secretary. Mr. G. J. Lough replied to the toast.

In the course of the evening subscriptions and donations to the amount of 966*l.* were announced, of which 804*l.* appeared in the President's list. The President further announced that the members of his firm present had agreed to increase their subscriptions so as to make the total amount up to 1,000*l.*

AMATEUR CONTRACTING.

THE following letter from Mr. John Leaning, F.S.I., has appeared in the *Times* :—

The question of religious tests has exercised the minds of the electorate to the exclusion of other important considerations. It is known to many that the London Building Trades Federation has sent a copy of questions to each candidate for election to the School Board for London. One of them is as follows :—"Are you in favour of the Board, where possible, doing their own work direct, and without the intervention of a contractor?"

The following extract from an electoral address may be taken as a type of the avowed opinions of some of the candidates :—

"Labour policy.—I am a trade-unionist, a supporter of trade-union principles, and an opponent of sweating in any department of the Board's work. In the interests of efficiency

and economy I support the direct employment when possible of labour by the Board, and when not possible the employment of those contractors only who pay the trade-union rates of wages and conform to the recognised trade-union hours of labour."

The above fairly expresses the views of those persons who would draw the School Board into a similar course to that adopted by the London County Council.

The use of the word "sweating" in connection with building operations is profoundly absurd. To compare their condition with that of those unfortunates who make shirts for a penny, or who are herded together in close rooms for very long hours, working at starvation wages, is even amusing. A complete absence of hurry at his work is the conspicuous quality of the builder's workman.

The confidence engendered in the workman's mind by the triumphs of the trade unions has made him lazier than ever before. Systematic loitering is common. The labourer with a hod filled with bricks shoots them out again as he hears the first stroke of the dinner hour, and the carpenter driving a nail leaves it half driven. As a consequence work costs much more than it did but a few years ago. Brickwork which cost about 3*l.* per rod for labour often costs 5*l.* and sometimes 8*l.*; other prices are rising in proportion. Moreover, strikes or threats of strikes occur on very small or no provocation.

If the trade unions insisted on a "standard" man as well as a "standard" rate of wages one might be comforted, but the only qualification for membership is the payment of a subscription.

The employment of men by the Board without the intervention of a contractor would aggravate these evils. Moreover, it is well known that no public body which directly employs labour obtains as much work from mechanics as does a private employer. Add to this the fact that directors of labour know that the difference between 5 per cent. profit and 5 per cent. loss on a building contract is dependent almost entirely on the quality of management and supervision, and the value of these forecasts of efficiency and economy may be easily estimated.

All experience contributes to prove that no public body can do work as cheaply as an outside contractor and all the weight of expert opinion is on that side of the question.

The vagaries of the London County Council within the last few years afford a striking warning against this amateur meddling with a trade of which the majority of the members know very little indeed.

ART PLATES FROM "THE ARCHITECT."

Awarded Gold Medals, International Health Exhibition and Architectural and Building Trades Exhibition (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing.

THE MARTYRDOM OF ST. STEPHEN. By E. J. POYNTER, R.A. Size, Forty Inches by Fifteen Inches. Price One Shilling. Free by post, carefully packed inside patent roller, One Shilling and Three Pence.

"AND THE SEA GAVE UP THE DEAD." By Sir FREDERIC LEIGHTON, President of the Royal Academy. A few Proofs of this Fine Art Plate can be obtained (if ordered at once), price Two Shillings each. Free by post, carefully packed inside patent roller, Two Shillings and Two Pence.

THE BANQUET. The well-known and beautiful Chromo-Lithograph by H. STACY MARKS, R.A. Size, Thirty-nine Inches by Fifteen Inches. Price One Shilling. Free by post, carefully packed inside patent roller, One Shilling and Three Pence.

1. AN OFFERING TO CERES. 2. THE EDUCATION OF BACCHUS. 3. MINERVA VISITING THE MUSES. 4. JUDGMENT OF MIDAS. By W. HAMILTON. Size of each plate, Forty Inches by Fifteen Inches. The whole forming a very beautiful Frieze in Bartolozzi Mezzotint. Price per set, Six Shillings on Proof Plate. Free by post, carefully packed inside patent roller, Six Shillings and Six Pence.

THE HISTORY OF JOAN OF ARC. By M. JULES EUGENE LENEVEU. From the Wall Painting in the Panthéon, Paris. Four Pictures on one Plate. 1. Domremi: Inspiration. 2. Orleans: Struggle. 3. Reims: Triumph. 4. Rouen: Martyrdom. Size, Forty Inches by Fifteen Inches, on Proof Plate. Price, Two Shillings. Free by post, carefully packed inside patent roller, Two Shillings and Six Pence.

THE WATERLOO HEROES. By J. P. KNIGHT, R.A. Dedicated, by Special Permission, to VISCOUNT WOLSELEY, K.P., G.C.B. Proofs, price One Shilling each (thin Plate Paper). Proofs (Special), price Two Shillings and Six Pence each (thick Plate Paper). Size, Twenty Inches by Thirty-six Inches. Framed and Glazed in Oak, Complete, One Inch, Twelve Shillings each. Ditto, One and a Quarter Inch, Fourteen Shillings each. Ditto, One and a Half Inch, Seventeen Shillings each.

THE TOILERS OF THE DEEP. Two Tinted Ink Photographs. Size, Eighteen and a Half Inches by Thirteen and a Half Inches. Price Two Shillings. Free by post, carefully packed inside patent roller, Two Shillings and Three Pence.

JOHN SELL COTMAN'S PICTURES, lately on Exhibition at the Burlington Fine Arts Club. The Plates are uniform in size, Twenty-one Inches by Fifteen Inches. The Titles are as follows:—1. Rouen from Mount St. Catherine. 2. Breaking the Clod. 3. View in North Wales. 4. Norman Arches. 5. Byland Abbey. 6. Norwich, from the Cromer Road. 7. Dewy Eve. 8. Mousehold Heath. 9. Cader Idris. 10. Castle Eden Dean, Durham. 11. Bamborough Castle. 12. The Interior of Norwich Cathedral. 13. Mountain Pass in the Tyrol. 14. Postwick Grove.

The price of the Set is Twelve Shillings and Six Pence; by post, carefully packed in patent roller, Thirteen Shillings. Kindly order early, as only a limited number of proof copies can be obtained.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the Publisher, P. A. GILBERT WOOD, 175 Strand, London, W.C.

Governed by a clique—glib, astute and energetic, practically nominees of the trade unions—they have succumbed to the seductive dream of the elimination of the middle man. A consideration of the building operations of the London County Council is instructive.

They began by adopting the trade-union hours and rate of wages. Their insistence upon these with their contractors, coupled with an unreasonably stringent set of conditions of building contract, raised the cost of all their works almost immediately.

Their next step was to establish a works department—still on the pretext of economy. This department has existed two years or thereabout, and they have lately issued an official statement of profit and loss on their building operations.

The item in which they specially exult is the construction of a storm relief sewer between Hackney and Holloway. They profess that it cost 8,051*l.* and that a contractor would have charged 12,673*l.* for it. This implies that the contractor would have made 4,622*l.* profit on the work, equal to more than 50 per cent.

So elated are they with this alleged result, that they have discussed the reasonableness of offering to do sewer work for other public bodies.

Other items of their statement show loss; one of the most striking is the New Cross fire station, which was estimated at 15,802*l.* and cost 18,786*l.*, a loss of 2,984*l.*

But I take leave to doubt a statement produced under the known conditions of this one. It is prepared by the Council's servants in its own offices, and those servants are naturally concerned to present the transactions of the Council in their best aspect. The statement is no doubt an exemplary instance of special pleading.

In considering the alleged saving on the sewer, anyone familiar with builders' work will admit the following propositions:—

That the average building contract rarely involves a profit of more than 10 per cent.

That building contracts are often done at 5 per cent, and not seldom, from the want of judgment of the estimator or unforeseen events, end in positive loss.

Taking these principles in conjunction with the fact that no public body gets as much work from the men as a private employer, and that the establishment charges of a public body are inevitably higher, one is led to the conclusion that the statement before mentioned would not bear the examination of

independent building experts, and that the much-talked-of efficiency and economy are a mere phrase to catch the labour vote.

Another question which the ratepayer may naturally ask is whether these experiments in amateur building are a legitimate part of the work which they elected their representatives to do. Surely their functions are limited to the administration of existing laws and regulations, and they very far exceed them when they interfere with long-established and therefore probably venerable economic principles; and it will surely be admitted that the exceptional favour shown to the building trades at the instance of the trades unions is, and must be, at the expense of all other classes.

One may also ask whether it is or not the duty of all public bodies to treat impartially all sections of the population.

In 1870 the more sanguine advocates of the Education Act prophesied that the School Board rate would not exceed 2½*d.* in the pound; it is now nearly a shilling. What it will reach if this building heresy is persevered in, your readers may judge. Its baneful effect upon the building trade is already apparent. The trade unions have done some good work and are well able to take care of themselves, and the truckling of public bodies to their special interests is unjustifiable and inexpedient.

THE NILE RESERVOIRS.

THE correspondent of the *Times* in Cairo, writing on the 18th inst., says:—Mr. W. E. Garstin, C.M.G., Under-Secretary to the Ministry of Public Works, has issued the note which he presented to the Council of Ministers on the 8th inst. upon the proposed modifications in the Assouan dam project, which was approved in principle by the Government last June. That project consisted in the construction of a dam having its crest at the reduced level of 114 metres, which would provide storage for water sufficient for the irrigation of Middle and Lower Egypt during the months when the Nile is low. Many European archaeological societies begged the Government to find some alternative scheme, and protested strongly against this project, involving as it did the submersion of the celebrated Philæ temples, together with a considerable number of important Nubian monuments, for a period of six months each year.

The Ministry, recognising the respect due to the reasons advanced, has endeavoured to reconcile the material interests

PROOF IMPRESSIONS of the BEAUTIFUL ART PLATES which appeared in the New Year's Double Number of "THE ARCHITECT," and in the Number for January 10, 1890, THE TOILERS OF THE DEEP. Two Tinted Ink Photographs (size 18½ in. by 13½ in.), may now be obtained, price 1*s.* each. Free by post, carefully packed in patent roller, 2*s.* 3*d.*—GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

of the country with those of science by submitting a modified scheme, which has received the approval of Government, and the question of providing the necessary funds will enter into the coming Budget. This modified scheme consists in the construction of a dam at Assouan having its crest at the reduced level of 106 mètres, or 8 mètres (26 feet) lower than that originally proposed, which will retain water sufficient for either Middle or Lower Egypt, but not for both.

The adoption of this scheme involves a much slower reclamation of the country, but entails the submersion of only a portion of the Philæ island, containing the smaller monuments, which could be protected by special works to be planned in accordance with the wishes of the learned societies, and it leaves the other numerous Nubian monuments untouched, as shown by Mr. Somers Clarke's note on their levels. In order to minimise still further any possible loss to science from the construction of such a vast reservoir, topographical surveys will be made this winter in order to fix the true bearings of the Nubian monuments, and preliminary plans will be executed of all sites, after which the learned societies will be invited to complete the work.

A minute study of the river from Wady Halfa northwards has convinced the irrigation engineers that Assouan presents the only site where the nature of the river bed and the rock formation render it safe to construct a work of such magnitude, and this opinion has been strongly confirmed by Sir Benjamin Baker and Signor Torricelli, two out of the three experts forming the technical commission brought from Europe to advise the Government. At Khaibar, near the third cataract, 150 miles south of Wady Halfa, a favourable site for a dam and reservoir is believed to exist, but no work is possible in that region until the Mahdists are expelled from Dongola, and even if such a dam were made a second would be required further north, nearer the point of delivery of the irrigation water, as otherwise the great waste from infiltration and evaporation would endanger the success of the scheme.

If funds are obtainable, no valid reason seems to exist to delay the commencement of the work, although the final estimates for the modified dam cannot be submitted before next spring. Now that Egypt has made such an immense concession of her material interests in deference to the wishes of European scientists, the latter incur an obligation to contribute substantial aid to the Government in its endeavour to preserve for their benefit relics which possess no interest and but little value for the people of the country.

The urgent necessity which exists for the reservoir is shown by the fact that the Irrigation Department cannot now supply sufficient water for the needs of cultivators. The Nile flood just past presented an exceptional cause for anxiety, for although previous floods have surpassed it in maximum height, it maintained during the critical month of October a level never reached before. During forty-one days it remained above 24 cubits at Cairo without an accident occurring, and the preventive measures involved only a trifling cost. This shows the good results accruing from the work of strengthening the banks which has been carried out during the past few years.

THE IRON TRADE.

At the opening meeting of the session of the West of Scotland Iron and Steel Institute in the Glasgow Technical College, Mr. James Riley, of the Steel Company of Scotland, delivered his inaugural address as president, to which post he had been elected for the third time. Speaking of the advantage of such associations meeting together, he said it was most essential in view of the competition from abroad that they should acquire the fullest knowledge possible of all that tended to the successful and economical prosecution of the varied operations and processes connected with their special branch of industry. The efforts of neighbouring nations in competition had been far too long treated with complaisance and light-hearted disdain, but the day for that had gone past and we were in the midst of a vital struggle, and our supremacy, if not already lost, was tottering. What still remained to us on the score of natural resources and advantages did not counterbalance the advantages our rivals possessed in the greater docility and steadiness of their workmen, as shown in the longer hours the latter worked or the amount of work they performed in a given time and the much smaller wages they received. He was not an alarmist and had not lost faith in his country or his fellow-countrymen; but he did feel, in the present depressed condition of our great industries, and with impressions due to a recent visit to many continental works fresh upon his mind, that it was incumbent upon us to be up and doing to fully qualify ourselves on all points for the contest in which we were engaged. Proceeding, Mr. Riley showed that the foundation of our eminence as a manufacturing country was our abundant and cheap supply of fuel. The waste in bygone years in that

material had been lamentable, but the vital importance of the cheap supply of fuel was now becoming recognised, and, on the one hand, in the mining industry everything was being done to treat the product of the mines so that the whole of it might be consumed, and, on the other, everything was being done by improved appliances, mechanical and otherwise, to insure the most exhaustive and economical use of fuel. As to the industry with which the Institute was most particularly concerned they heard a great deal of its decadence in Britain, and the relatively greater advance of Germany and Belgium in productive capacity and as exporters of iron and steel. While perhaps they had not done all they might to meet the keenness of the continental opposition, it had been overlooked or ignored that some of this relatively more rapid extension of trade was absolutely unavoidable on our part. By the successful working out of the basic process of steel manufacture, immense advantages were conferred on continental countries to our corresponding detriment.

When that process was discovered in 1881, he stated the probability that continental countries would become formidable rivals to this country in their own and foreign markets, as it would enable them to be independent of supplies of hematite pig-iron from this country. That anticipation had been realised. It might be—he did not aver that such was the case—that in this country they were subject to more rigorous treatment in inspection and testing; but, whatever was the explanation, the fact remained that the basic steel used—and apparently with most satisfactory results—on the Continent and elsewhere largely exceeded that which was produced in this country. A curious phase of matters was that we were importing hundreds of thousands of tons of ore annually for the purpose of making pig-iron from which to produce satisfactory steel, while our own native resources were left comparatively unused. In Cleveland, with millions of tons of ore close at hand, something like half the total of pig-iron was made from imported ores. In regard to the various processes of steel manufacture, he had always maintained the superiority of the open-hearth process for producing regular and uniform results, and if the basic process was to be carried out in such a manner as to win the confidence in its products which was enjoyed by the acid process, it must be on the open-hearth furnace. In the remainder of his address Mr. Riley dealt with the various processes of manufacture, and described some of the most recent improvements in the methods of manufacture in the direction of improving and cheapening the products.

DELAYS IN EXECUTING ORDERS:

AN action was brought at the Widnes County Court before his Honour Judge Shand, by Edwin Wood, builder and contractor, Widnes, to recover 4*l.* damages from the Warrington Slate Company for breach of contract in the delivery of slates. Plaintiff's case was that he ordered from one of the defendants' travellers 2½ "mill" of Velinheli new quarry slates to be delivered on the 12th, 13th and 15th of the same month. No slates coming to hand on the 12th, the plaintiff communicated with the defendants and received a reply to the effect that there had evidently been some misunderstanding on the part of their traveller, and that they would be unable to supply the slates until the arrival of their vessel from Port Dinorwic. The plaintiff had in consequence been compelled to purchase other slates at an increased cost of 4*l.*, hence the present action. The claim was resisted by the defendants, who gave a different version of the terms of the contract. His Honour gave judgment for the plaintiff for 3*l.* os. 6*d.* with costs.

LONDON BOARD SCHOOLS.

IN the annual report of the London School Board it is announced that during the year ended March 25 last the Board were engaged in purchasing interests in 50 sites. This task is carried out by the works committee. In the case of 13 of these sites the land was acquired for erecting new schools or enlarging existing schools, and in the case of the remaining 37 for completing sites previously purchased, for enlarging the playgrounds of existing schools, or for carrying out general improvements to schools. The total expenditure on the sites was 350,363*l.*, with 35,816*l.* costs. The total number of sites for schools which had been or were being purchased at Lady Day last was 435. In the case of 295 of these sites, where the building accounts have been closed, the cost of the land has been accurately ascertained and is set down at 2,321,226*l.*; and as the schools erected upon them provide a total accommodation for 341,756 children, the cost of the sites per head is 6*l.* 15*s.* 1*d.* Fourteen new schools were opened during the year at a total cost (including sites, building and furniture) of 377,278*l.* 17*s.* 8*d.*, or 28*l.* 7*s.* 1*d.* per head, the accommodation being for 13,305. The schools were paid for out of a loan of 400,677*l.*, authorised by the Education Department. Enlargements of twenty-five schools, affording accommodation

for 8,246, were also completed and opened in the twelve months, the tenders for which amounted to 153,907*l*. Tenders were accepted for four new schools, twenty-one enlargements, four new junior mixed schools, and two pupil teachers' schools, and of course there was a large amount of building work in progress. Besides all this, provision is being made for new cookery centres, laundry centres, manual training centres, centres for the instruction of the deaf, a school for special instruction, and centres for the blind. The drainage of all the 430 schools of the Board has been reported upon, and the Board have appointed a sanitary surveyor for the purpose of preparing plans and superintending the drainage and sanitary work required. Much of the work has already been carried out. An event of the year has been the completion of the head offices of the Board on the Victoria Embankment, which include a handsome Board-room and a well-appointed library. Another very desirable step has been taken in the opening of additional school playgrounds on Saturdays and Sundays. Some 207 of these playgrounds are now open on Saturdays and forty-six on Sundays.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

THIS Society visited the works of Messrs. Bullivant & Co., in the Isle of Dogs, where the processes of making steel wire cables and ropes, torpedo-catching nets and wire netting is carried on. The members of the Society were taken over the works by one of the partners; they were shown every detail of the manufacture, from the testing of the wires before they are made up into ropes to the testing of a finished heavy cable. The various machines in the cable shop were carefully explained, as was also the process of galvanising the wires. The process of making the torpedo-catching nets was examined, and the excellence of these was a matter of comment by those present, every care in their construction and much forethought in their design being and having been devoted to them. The wire-net making machines were next examined, and they showed much ingenuity in their scheming out; many thousands of miles had been made by them and sent to all parts of the world. The visitors were shown over the various engine-houses and the boiler-house, the contents of which were all of a first-class character. The wire stores were inspected, many hundreds of tons being always kept in hand ready to meet sudden demands. The testing-house in which tests are made by special machines

(designed by a member of the firm) of the finished cables was inspected, and a portion of a 4-inch cable tested to destruction. The machines for testing the wires before they are made into ropes were also in this house, the testing being both for tensile stress and torsion and the method explained.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 21163. Arthur Raymond Tonks, for "Improvements in pins and keys on which they turn in locks."
- 21212. William Zachariah Mocket, for "An improved window-sash holder."
- 21214. Loftus Balfour Moreton and John Stoker, for "Improvements in locks."
- 21217. Jesse Carter, for "Improvements in and relating to stoves or fireplaces and fuel for same."
- 21275. Thomas Henry Vercoe, for "Improvements in and relating to sewers."
- 21280. George Joseph Bowcock, for "An improved combined door latch and lock."
- 21305. Oswald Barker, for "New apparatus for disinfecting water-closets."
- 21308. Thomas Marshall, for "Improvements in window-sashes."

West End Showrooms:—57 WICMORE STREET, LONDON, W.

Chief Office:—30 DUNCAN TERRACE, CITY ROAD, LONDON, N.

WINTER, WARMTH AND COMFORT.

HEATING AND VENTILATING APPARATUS. GRUNDY'S SPECIALTY. PURE WARM AIR.

UPWARDS OF ONE THOUSAND TESTIMONIALS RECEIVED.

PURE WARM AIR AS SUPPLIED TO

Truro Cathedral; Londonderry Cathedral; Sherborne Abbey; Kilmore Cathedral; Stanley Cathedral, Falkland Islands; Cardiff Catholic Cathedral; the Queen's School Chapel, Eton; Cork Asylum; Leicester Asylum; and to upwards of three thousand Places of Worship; and a great number of Mansions, Houses, Hotels, Hospitals, Schools, Warehouses, Factories, Workhouses; Cork Law Courts, &c., &c.

84 Brook Street, Grosvenor Square, W.: December 8, 1893.

Sir WILLIAM BROADBENT encloses cheque for the "GRUNDY" HEATING APPARATUS supplied to his house, and is glad to say that it has proved very satisfactory for warming and ventilating as required. The principle of the apparatus is most excellent.

To Mr. Grundy.

PROFESSOR TYNDALL writes:—

Dear Sir,—My house being so well provided with grates and flues for the generation and distribution of pure warm air, I have been thus enabled to spend my winters in England instead of on a foreign shore.—Yours very truly,

JOHN TYNDALL.

Fever Hospital and House of Recovery, Cork Street, Dublin: October 26, 1894.

Dear Sir,—I have much pleasure in informing you that we have found your HEATING APPARATUS a great success in our new Epidemic Hospital, which consists of a two-story building, each story containing two large wards, a smaller isolation ward and two nurses' rooms. It is easily managed, does not cost much for fuel, and the air entering is most pleasant, warm, and free from smell. It is with the full concurrence of the Managing Committee I give you this testimonial.

Yours faithfully, JOHN MARSHALL DAY, Registrar and Resident Medical Officer.

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

VARIETIES.

THE *Staffordshire Advertiser* says:—Newcastle-under-Lyne was probably the first town in the county to adopt gas lighting, the original Act of Parliament having been obtained in 1819, or about six years after the new system was adopted in the Metropolis. Want of experience in those early days led to the erection of the works on a level with the greater part of the town, but the concern, primitive as it must have been, was carried on until 1855, when the growth of the town made it necessary for the company to erect new and improved works in a lower situation. These works in their turn supplied the town for nearly forty years, and have just been replaced by the Corporation, who acquired the undertaking in 1880 for 75,000l., with new gas-making apparatus and buildings of the most modern type, capable of dealing with the growing requirements of the district for some years to come.

At the meeting of the Carlisle Architectural Association Mr. F. J. Nickols, of the city surveyor's office, gave an address on the "Housing of the Working Classes," expressing himself in favour of back-to-back houses.

MR. GEORGE PAYNE, F.S.A., delivered a lecture to the members of the Maidstone Philosophical Society on "Roman Pottery and Roman Tiles." He expressed the belief that the pottery makers of the present day based their ideas and did their work upon the principles of the Roman potters, taking their designs in the first instance from the shape and make of the Classic specimens of the potters' art that he exhibited.

At the meeting of the Southgate Local Board it was announced that Mr. V. E. Walker, J.P., of Arncliffe Grove, Southgate, had promised 1,000l. towards the completion of the new Southgate Recreation Ground, provided the Friern Barnet, East Barnet and Southgate Local Boards contribute another 1,000l. between them.

At the meeting of the Govan Dean of Guild Court, Messrs. A. Stewart & Co., Glasgow, were granted lining to erect five tenements of four-apartment dwelling-houses in Paisley Road West.

It is stated that the damage done in Cyprus by the recent floods is estimated at 100,000l.

"SPHINX" PORTLAND CEMENT.

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 14 inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors & Street Paving.

"ECLIPSE" PORTLAND CEMENT, quick-setting; test, 3 parts. Standard Testing Sand, 230 lbs. per square inch; 28 days. The finest, most plastic, best sand-carrying and cheapest cement in the market.

Specially adapted for laying encaustic tiles, making joints in sanitary pipes, internal stucco, concrete foundations, &c. Samples sufficient for Practical Tests Free. Manufactured by JOHN BOARD & CO., Dunball, Bridgwater.

READING CASES FOR THE ARCHITECT

Price 2s.—Office: 175 Strand, London, W.C.

THE *Leeds Mercury* says that the Governors of the Northallerton Grammar School have received a generous offer of land, at a price much below its real value, from the Ecclesiastical Commissioners, who are the largest landowners in Northallerton and district, and also lords of the manor of Northallerton, for a site on which to build a new Grammar School and playground.

At the Port Glasgow Dean of Guild Court, Mr. Patrick Jamieson, builder, applied for leave to erect two double villas on the ground behind Springhill, Barr's Brae. The plans were approved and permission granted.

At the meeting of the Leeds and Yorkshire Architectural Society, at the Leeds Mechanics' Institute, a paper by Sir George Chubb, on the "History and Development of Locks and Safes," was read by Mr. H. W. Chubb.

THE Manchester Corporation appealed to the Queen's Bench Division against the assessment of the public libraries of the city under schedule A of the Income Tax Act, contending that the libraries came within the exemption contained in the Act in favour of "any building the property of any literary or scientific institution." Justices Wright and Collins decided against the Corporation, whose counsel thereupon said they would have to go to the Court of Appeal.

THE *Birmingham Post* states that the gas committee have resolved to recommend the Birmingham City Council to reduce the price of gas for private purposes by 3d per 1,000, and to make a proportionate reduction on public lighting, as from the next quarterly reading of the meters.

At the meeting of the northern district of the Incorporated Association of Municipal and County Engineers, held in Middlesbrough, Mr. T. W. Stainthorpe, surveyor to the Eston Local Board, read a paper on the River Tees Floating Hospital, which had been built at a cost of 10,000l. The structure was described as the finest floating hospital in the kingdom.

THE cleaning and lighting committee of the Edinburgh Town Council have unanimously approved of Councillor Cameron's motion for the construction of an underground lavatory for men and women in the Grassmarket, and recommended the Town Council accordingly. This is the first one of the kind in the city.

At a special meeting of the Ayr Town Council, a committee was appointed to acquire a site for the electric light works.

THE final disposal of "Constantinople in London" has been effected, Messrs. E. & H. Lumley having sold by auction on the ground at Olympia the electric-light fittings, machinery and miscellaneous effects. Among the machines sold a Crossley Brothers' "Otto" gas engine, 1½ horse-power, 12-inch stroke, brought 26l. The four-turn elliptic turnstiles, which registered 1 to 10,000, by C. Isler & Co, sold at from 3l. 17s. 6d. to 4l. each. The scenery, painted by Messrs. Amable & Gardy, sold as follows:—Scene 1, representing an old English mansion, with village in the distance, brought 15l.; one Spanish scene, 26l.; Vienna, 31l.; the act drop, representing a landing-stage on the Bosphorus, with palaces, 20l.; the panorama of Constantinople and the Golden Horn, 25l.; Roumelia, 45l.; the Slave Market, 10l., and the scene representing the seraglio, palace and coastguard, measuring 3,000 square yards, realised 63l.

THE late Mr. James Kent, contractors, of Coatbridge, who died in last December, directed his trustees, after providing for certain legacies to friends, to divide the residue of his estate in their discretion among religious and charitable institutions in Coatbridge or Glasgow. The sum of 1,727l. has accordingly been distributed without distinction of creed.

BUILDING AND BUILDERS.

PLANS by Messrs. Patman & Fotheringham have been adopted for new farm buildings at East End, Finchley.

At the meeting of the Finchley Local Board, Church End, the tender of Mr. Hawkins, Harringay Park, was accepted for a new mortuary.

THE Carlisle School Board have decided to build a new girls' school on a site in Brook Street.

At a meeting of the governors of the Glasgow and West of Scotland Technical College a minute of the new buildings committee was approved. The minute states that the complete new building scheme involves the expenditure of 100,000l. at least, and that there is urgency in raising 25,000l. as soon as possible, in order to take advantage of the offer of the Bellahouston Trustees to contribute the same amount.

AN addition to the main building of Olympia, 50 feet long by 30 feet wide, is about to be made. It is intended for the exhibition of a moving panorama. It is also proposed to erect a crystal fountain at the south-west angle of the main building.

Trade Mark (Regd.)

At Manchester a meeting of Churchmen was held at the Town Hall with the object of promoting the cause of Church secondary schools in general, and in particular of raising a sum of 3,000% towards the building of St. Cuthbert's College, Worksop.

TRADE NOTES:

FOR the ventilation of the Lanark County Hospitals now being erected at Shotts, Stonehouse, Longriggend, and Motherwell, Mr. Alexander Cullen, architect, a large number of the Climax patent direct-acting invisible chimney terminal ventilators and ridge ventilators are being used, and have been supplied by Messrs. Cousland & Mackay, ventilating engineers, of Glasgow and London, the sole manufacturers of these ventilators.

THE Local Government Board have sanctioned the application of the Finchley Local Board to borrow 2,444% for private street improvements.

THE new schools, Nantymoel, are being warmed and ventilated by means of Shorland's patent Manchester grates, stoves and patent exhaust roof ventilators, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

IN Edinburgh Provost McDonald had a meeting with Sir William Arrol in reference to the question of inserting in the contract for the erection of the new North Bridge the clause usual in municipal contracts binding the contractor to the payment of fair or standard wages. Sir William Arrol, it is understood, stated that it would give him great pleasure to insert and sign such a clause.

THE Rhyl Improvement Commissioners at the beginning of the year obtained borrowing powers to the extent of 20,000% to complete the system of town sewerage, and they have now applied for a supplementary loan of 9,286%.

THE Admiralty have decided to remove the Vanguard Shoal in Plymouth Sound, thus greatly improving the entrance to Devonport Dockyard. The work, which will occupy several years, will be commenced at once.

A LOCAL Government inquiry has been held at West Bridgford to consider an application from the Local Board to borrow 5,000% for sewerage purposes. The scheme embraces a new 15-inch iron outfall sewer, a night storage tank, 30 feet deep, a new engine and pumping plant, and improving the present sewage farm by putting in drains and extending

the sewage carriers. The object of the works is to provide for the sanitary wants of a rapidly increasing suburb. The engineer is Mr. W. H. Radford, C.E., of Nottingham, whose scheme was selected in open competition.

STATUES of SS. Mary and John, each about 6 feet high, by Messrs. Earp & Hobbs, of Lambeth Road, Lambeth, S.E., and Manchester, have just been placed in position at All Saints Church, Middlesboro'. They occupy niches on the interior walls of the western end of nave arcades.

GLASGOW NEW CONSERVATIVE CLUB.

THE new Glasgow Conservative Club will be formally opened to-morrow by Sir Edward Clarke, Q.C., M.P. Since 1880 the club has occupied quarters in Renfield Street, but a constantly increasing membership necessitated the finding of new club premises in some part of the city, and an admirable site for them was secured in Bothwell Street at the corner of Wellington Street. Bothwell Street may now be regarded as one of the Glasgow streets of the future, and the Conservative Club adds another to a group of commercial and public buildings ranging along both sides architecturally more imposing than is to be seen in any other thoroughfare in the city. Colonel R. W. Edis, of London, was the architect of the new club, which has cost fully 33,000% apart from the cost of the site. By entrusting the designing of the club to Colonel Edis, the Conservative Club committee placed the work in the hands of an architect who has drawn up the plans for two of the largest clubs in the world—the Constitutional Club in Northumberland Avenue and the Junior Conservative Club in Piccadilly, London, and it is claimed for the new Conservative Club that it is the finest in Scotland. The membership of the Conservative Club is at present 1,200, but the new premises will give accommodation for 2,000.

The new clubhouse occupies a prominent site at the corner of the two streets—Bothwell and Wellington—and the architectural style is a free treatment of the Scottish Renaissance. Owing to the smoke and dirt with which the atmosphere of the Western capital is impregnated, the architect selected red sandstone as the most suitable material for building the structure, and externally he has avoided as far as possible all carving or elaborate work of any kind. But while simple in general treatment, the exterior is not without certain striking features, owing to the arrangement of the fenestration work and the

crow's-foot gabling, the latter having a flanking of small circular turrets, which gives a picturesque touch to the sky-line. The club-house has a frontage to Bothwell Street of 74 feet and to Wellington Street of 106 feet, and it is backed by a lane running along the full length of the building. From the street level the height of the building is about 90 feet, divided at the front into three principal floors and two upper floors, in addition to the basement, while at the back part of the building eight floors have been obtained by dividing the high flats in mezzanine fashion.

The main entrance is in Bothwell Street, and it has been treated with boldly-carved figure work and granite columns, with a central panel, introducing the arms of the club over the doorway. The outer hall is of small dimensions, but a flight of marble steps, 10 feet wide, leads to the inner hall, which constitutes one of the features of the premises. It is 40 feet long by 24 feet wide, and is arranged with statuary, and divided by Sienna stone columns. A dado of Belgian marble surrounds it, and in the centre there is a magnificent fireplace. From the hall the dining-room, measuring 74 feet by 25 feet, is entered. It has a ceiling height of 20 feet, and the apartment is divided into three by beautifully ornamented Corinthian pillars. The mantelpiece is designed in marbles of different kinds. Huge bay windows flood the room with light by day, and graceful electroliers will supply light by night. Connected with the dining-room there is a very fully-equipped servier. On this floor there is also a large morning-room, and adjoining is a waiting-room for visitors. From the inner hall the grand staircase is ascended, and it is lighted by a series of windows in delicate Grisaille glass with figures of St. Andrew, St. George, St. Patrick, St. David, St. Mungo and St. Tennock—the latter being the old spelling for St. Enoch. The stair railings have also been artistically designed, the wrought-iron work introducing the rose, thistle and shamrock. On the first floor the smoking-room is the principal apartment. It measures 70 feet by 25 feet and has three recess bays facing Wellington Street. The library, a private billiard-room and a committee room, each about 25 feet by 24 feet, are arranged on this floor also. On the second floor the whole of the frontage to Bothwell Street has been utilised for a billiard-room similar in dimensions to the smoking-room and also divided by columns. It has been furnished with three tables. There is also a card-room on this flat and the remainder of the floor space here is set apart for members' bedrooms, of which there are some thirty-five,

and for the club-master's apartments. From this flat the mezzanine floors have been introduced largely. In the upper flats there is ample room for servants' sleeping accommodation, and in the basement servants' day accommodation has been provided, the kitchen—an apartment 44 feet by 25 feet—being also here. Extensive lavatory accommodation has been provided all through the building. A convenient arrangement is that the whole of the service of the club is carried up inside the building connecting with every room, and thus obviating the necessity of servants passing through the halls or principal landings. There is a double service of lifts. The architect has very successfully dealt with the question of giving plenty of light to the various rooms and corridors in the building, and a duplicate system of electric lighting will supply the necessary artificial light.

The contractors for the whole of the building were Messrs. Morrison & Mason, of Glasgow, who in turn sub-let the work to other tradesmen. Mr. J. Woodward was the master of works. The furnishing was done by Messrs. Wylie & Loch-head, of Glasgow, and Messrs. Maple & Co., of London.

COTTAGE HOMES, SHEFFIELD.

ON Saturday Sir Walter Foster, M.P., opened the new homes for pauper children erected by the Sheffield Poor Law Guardians.

The new buildings are situated on the Goddard Hall estate, in Smilter Lane, Crabtree. The gates opened by Sir Walter adjoin the lodge of the administrative block and receiving home, in which are a spacious waiting room for applicants and parents visiting, medical officer's and examination rooms with bath, sitting rooms for the foster parents, a commodious kitchen, separate dayrooms for boys and girls, lavatories, baths and storerooms. There are separate staircases and dormitories for boys and girls, with a bedroom for the foster parents. Iron escape stairs are placed outside of each dormitory, while across a yard from the girls' side are placed clothes store, washhouse, laundry and disinfecting house, with independent entrance. From the lodge corridor run spacious stores, and on the upper floor is a large and well-lighted office for the superintendent and a commodious committee-room. On the landing of the principal staircase is an ornamental moulded marble tablet, with an inscription recording that the building and the three cottages and hospital on the adjoining land were erected A.D.

1a Ludgate Hill, E.C.; 33 Bold Street, Liverpool, &c.

1894, as the headquarters for the Isolated Children's Homes, originated by Mr. John Wycliffe Wilson, J.P., chairman of the Sheffield Board of Guardians. In the same building and over the principal stores is the residence for the superintendent, which is placed so as to effectually command the entrance to the premises from the road and the various buildings. The three detached homes which at present complete the headquarters, and which have been respectively named "Ivy Cottage," "Hawthorne Cottage" and "Rose Cottage," are to the west of the entrance, each having a piece of garden, a playground, a shed and a washhouse. The children's hospital is on the same estate, but approached in a northerly direction from the road between the three cottages and the administrative block. This building is intended ultimately to be connected by a corridor with the administrative block of the general hospital, which will be between it and the workhouse. It is placed nearer the "house" than any other of the children's homes, with the object of rendering available the medical officers and kitchens of the main hospital. All the buildings are purposely simple and most substantial in character. Electric bells are fitted throughout, and the greatest care has been given to the arrangements generally. Mr. C. J. Innocent has been the architect; Messrs. George Longden & Son, Neepsend, the contractors; and Mr. George Malpas, the clerk of works.

WIDENING OF THE STRAND.

THE sanction of the High Court has been obtained to the promotion of a Bill in the ensuing Session of Parliament with reference to the Liberator Building Society's buildings, now in course of completion, between the Strand and the Thames Embankment. Under the powers to be inserted in the Bill Parliament will be asked to authorise a widening of that portion of the Strand facing the Embankment Buildings. The two exact points between which the widening is proposed to be effected are comparatively unknown narrow passages, described upon the plans now being prepared as Ivy Bridge Lane and Carting Lane. The scheme will include the widening of Carting Lane, from the Strand to the rear of the Savoy Theatre, and also the entire discontinuance for public use of Salisbury Street and Cecil Street. The cost of these improvements and the cost of passing this Bill through Parliament are, it is proposed, to be borne by the Liquidator to the Liberator Building Society and J. W. Hobbs & Co., Limited.

BISHOPSGATE INSTITUTE

NEW PRESBYTERIAN CHURCH, HEATHFIELD ROAD, BIRMINGHAM

ACKWORTH SCHOOL, PONTEFRACT.

To meet modern requirements in the way of technical instruction new workshops have recently been added to the fine block of buildings known as the Society of Friends' School at Ackworth. The school was founded in 1778 by Dr. Fothergill, a well-known London physician, who, with other members of the Society of Friends, purchased the estate and the buildings, which had been erected in 1759 to serve the purpose of a Foundling Hospital. As a hospital the career of the institution was short-lived, and upon the withdrawal of the Government grant in 1773 it had to be closed. The plan of the school consists of a centre and two wings connected by means of quadrant colonnades. It is said that the central block was planned by the Rev. Timothy Lee, D.D., vicar of Ackworth, who had Sir Rowland Winn as his colleague, but it is evident from the detail of the building that assistance must have been given by an architect conversant with the characteristics of Italian architecture. John Smeaton, the celebrated engineer of the Eddystone Lighthouse, is credited with the original arrangement for the water-supply.

In designing the new annexe for technical purposes, care has been taken that it should harmonise as far as possible with the old Georgian buildings. It is a one-storeyed building, 60 feet long by 30 feet wide, one-half of it arranged as a classroom with working-bench for twenty students, and the remaining half fitted up with benches and lathes for leisure hour pursuits. A short corridor connects this latter room with the gymnasium. In height the rooms are 13 feet 6 inches to the plate, and 16 feet 6 inches to the ceiling. The walls are faced with stone from the Ackworth Moor top quarries and lined inside with brick, and the roof is covered with green Tilbert-waite slates. The floors are laid with substantial floor boards on a concrete bed. In addition to the window lighting, additional illumination is provided by means of north roof lights. The rooms are heated by low-pressure hot-water piping. The new extension, which was opened on Thursday, November 22, by Mr. Thomas Pumphrey, of Newcastle, the

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM)

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

**TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF
THE CONSUMPTION OF GAS.**

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (*i.e.* the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 1, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

SIEMENS' BURNERS, 23 calories per candle per hour.

ARGAND " 44 " " " " "

[illegible]

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

chairman of the school building committee, has been erected by Mr. John Simpson, of Ackworth, from the designs and under the superintendence of Mr. William H. Thorp, F.R.I.B.A., of 61 Albion Street, Leeds.

REGISTRATION OF PLUMBERS.

AN examination of master and operative plumbers was held on Saturday at Borough Road Polytechnic. Candidates were present from London and the district, and from the following country places:—Eton, Seaford, Southend, Bedford, Harpenden, Weymouth, Newbury, Canterbury, Cambridge, Reading, Bexhill, Gravesend, Hove, Sandwich, Tunbridge Wells, Colchester, Midhurst and Newmarket. The practical tests included lead-bossing, pipe-bending and joint-making. The examination questions included the subjects of roof-covering, contamination of drinking water by faulty connections, arrangement of bath, sink and closet wastes, drainage of town houses, disconnection with sewers. The examiners were Mr. Charles Hudson (chairman of the London Board of Examiners), Mr. W. Titmas, plumber and builder, and Messrs. A. S. Pace and C. Hill, representatives of the United Operative Plumbers' Association of Great Britain and Ireland, Mr. C. T. Millis, superintendent of trade classes. Twenty per cent. of the masters and 25 per cent. of the operatives passed the full examination.

AN examination in the theory and practice of plumbing was held at Cheltenham in connection with the District Council for Bristol and the counties of Gloucester, Somerset and Wilts. The governors of the Technical School kindly placed the premises at the disposal of the committee. Candidates attended from various parts of the district, and were examined in the theory of plumber's work, including house drainage and water supply, and the practical part of the examination was such as to test the candidates in lead-bossing, joint-wiping and pipe-bending. The examiners were Messrs. J. H. Holbrook (master), Bristol; S. Sydenham (master), Bath; T. O. Lloyd (operative), Bristol; S. A. Dowding (operative), Bath; Walter H. Perry, Bristol, honorary secretary; the newly-appointed secretary, Mr. J. W. Holbrook; and Major A. K. Abbot, honorary secretary to the Cheltenham local committee. The report to the central authority recommended that fully 75 per cent. of the candidates be granted certificates, and the examiners were struck with the marked improvement in the work executed, thus showing that the movement is exerting a beneficial influence upon the trade.

FREE CHURCH, MORNINGSIDE, EDINBURGH.

THE present church in Morningside Road, as it now exists, dates back some sixteen years. It had been added to and extended at various times to meet the increasing demands upon its accommodation, and so greatly has the congregation increased under the pastorate of the Rev. Alexander Martin, that the existing building has again been found quite inadequate to accommodate even the seatholders. In view of this drag upon the administration of the church, and the absolute necessity, if its usefulness was to be maintained and extended, of finding somehow the accommodation required for members and adherents, a remit was made to Mr. Hippolyte Blanc, A.R.S.A., Edinburgh, to ascertain if, by any possible extension or reconstruction of the existing building, the extra seats could be procured. Several schemes were drawn out, but each only strengthened the growing conviction that the inadequacy of the site itself was insurmountable, and that by no planning, save the objectionable expedient of double galleries, could the required accommodation be devised. It was then decided to build a new church upon another site, and to continue worshipping in the old church until the new edifice was rendered habitable. The site selected is within a stone's throw of the old building, being situated further south on the opposite side, near the Churchill corner of Morningside Road. Before operations could be begun the site had to be cleared of the villas which then occupied it, and in May 1893 the foundation-stone of the new church was laid by the Rev. Dr. W. C. Smith, Moderator of the Free Church General Assembly for that year, and who preached the dedication sermon. As specially desired by the congregation, the building is designed in a phase of the Renaissance period, with campanile tower at the south-west corner, the building of the upper stages of which it is intended to leave meanwhile in abeyance. The building being surrounded on back and sides by adjoining properties, the respective elevations have been treated in very simple yet effective manner, the distinctive architectural features being confined to the tower and street front. The church is placed at some distance from the street, and the old trees have been allowed to remain untouched. The front boundary will be marked by a low wall, surmounted by an ornamental stone cope and wrought-iron railing of appropriate design. The plan of the church is an elongated rectangle, and it comprises the church area with recessed pulpit platform and organ chamber at one end, with spacious vestibule and staircases at the others. Behind the church is a

large hall accommodating 250 persons, classroom for sixty infants, vestry, session-room and soiree kitchen; in an upper floor there is an additional classroom and a caretaker's residence. Towards the street the main building presents a composition of two stages, the lower pierced for three doorways grouped within two massive piers of channelled ashlar-work. The entrance vestibule, which is paved with ceramic tiling in geometric design, measures about 30 feet by 20 feet, and at either end of it are the main stairways leading to the galleries. The interior treatment of the church is somewhat novel and most effective. To keep the interior as light and airy as possible, instead of heavily-projected galleries, those along each side have been projected to an extent to accommodate only a single row of sitters. They are supported upon cantilevers without any pillars, and their shallowness obviates the necessity for windows being placed under them. The back gallery is of normal depth, being extended over the entrance vestibule below. A passage of communication runs behind the sitters in the side galleries, and throughout the church there is an uninterrupted view of the pulpit secured to every sitter. By this mode of construction, moreover, any cold currents of air descending the walls are not felt. Both for the area and gallery floor, heating radiators are placed in wall recesses at regular intervals, which further act against any down currents of air. The pulpit is a most successful design of novel form and is placed slightly off the centre of the platform, that position being occupied by the Communion table. The total accommodation of the church is upwards of 800, the pews for sitters being of the most modern dimensions. The material used for mason-work is red Corsehill stone, for the constructive woodwork red pine and for the finishings yellow pine. The estimates came to about 9,600*l.*, and it is expected that that sum will not be exceeded.

THE GLASGOW CORPORATION AS BUILDERS.

In a paper on the Municipal Industries of Glasgow, read before the Philosophic Society, Dr. William Smart dealt with the building operations of the Improvement Trust, which produces 3*l.* 18*s.* 18*d.*, 3*l.* 11*s.* 7*d.* and 2*l.* 17*s.* 4*d.* per cent. He said, assuming these returns are kept up in the future, and that all proper charges have been included in the annual expenditure, it appears as if this experiment had justified itself by success—if success is to be measured by the avoidance of present loss

to the ratepayers. When a Corporation borrows at less than 3 per cent. from the public and invests that money in property that yields that amount, neither is the ratepayer directly taxed nor is the common good estate of the Corporation, in which every citizen is a part owner, in any way prejudiced. But why, of all industries, select the innocent trade of house supply for invasion, and so compete with an industry which is neither a monopoly nor an evil? The reasons given by the Trust are these. Owing to the stagnation in trade the City Improvement Trust found itself in possession of large areas which it had cleared of slums but could neither feu nor sell. Past experience seemed to show that, on the whole and in the long run, land in the centre of the city did increase in value and was accordingly a safe investment to hold. But meantime these building sites were earning no return. At the same time came the revelations of the housing of the poor in London and the agitation for supplying the very poor with houses that should not outrage the new canons of sanitation and cleanliness. It seemed to the Trust that it would be leading the way in this direction and at the same time improving the financial position of the Trust if they utilised their unfeued spaces by erecting dwellings that would serve as models of what dwellings for the poor should be. Guided by these motives and seconded, possibly, by those who saw in this the beginnings of a socialistic system which would extend in time to other private enterprises, the Trust began to erect the model dwellings in Saltmarket and elsewhere. I am not sure that I shall earn the gratitude of the improvement trust committee when I contend that the enterprise in this respect has justified itself by its failure. The sinking of 100,000*l.* in buildings will do very little, one way or another, to affect the supply of houses; it may be quite sufficient to decide an economic question of the deepest practical importance.

Five years ago the Workmen's Dwellings Company was founded for the purpose of providing comfortable and thoroughly sanitary houses for working people, at the rents current for the same amount of accommodation in the neighbourhood. In the new building in Rotten Row it provides two-roomed houses at 9*s.* 8*d.* per month, with a bonus of two weeks free in the year, while the Improvement Trust charges 11*s.* 4*d.* and 13*s.* 4*d.* for one-roomed houses. In its last annual report it is said that the rents current in the company's houses are practically the same as those of the "ticketed houses;" but keeping rents at this low figure the company cannot obtain more than 3·7 per cent. of return, and that at a time when repairs are at a minimum,

Cases for Binding the Architect.—Price Two Shillings. Office, 175 Strand, London, W.C.

and there are no unlet houses. And here we have the municipality, with all its experience in municipal industries and obtaining its money at the cheapest rate, making a similar experiment, charging considerably more rent, and able to do no more than clear interest on the money borrowed—the inference being that if the Trust had really faced the housing of the very poor, as the private company has done, it could not pay its way at all. I contend that the City Improvement Trust in its building scheme has made an experiment which had to be made, and that it deserves our gratitude as citizens for the lesson it has demonstrated. What is that lesson? From this place last year I had occasion to point out what nobody seems to take to heart, that with all our wealth we are still very poor. The money income of our nation, divided out equally among the population, would give, roughly, 33*l.* of income per head, which I am afraid is not a “living wage” for anybody. And even when we put this statistic in a more truthful way—for nothing lies like figures except facts—that an equal division of income would give only 16*5**l.* per family of five, it shows how impossible it is just now for even a large minority of us to have in our houses anything approaching luxury. Even if we were to discover any plan by which all the new wealth that comes into the world hereafter should go solely to the classes who have not enough now, there are a great many necessities of thoroughly wholesome life which, for many a long year yet, we could not expect to see in poor men’s houses.

Now, in this matter of housing, our appetite seems to me to have outrun our pockets. It is not so long since water led into private houses was unthought of, not to speak of bathtubs, wash-hand basins, and all manner of conveniences. The standard of comfort among the rich has risen so rapidly that many of us are demanding similar demands for the poor, without asking the previous question of whether they or we can afford it. I make the suggestion with diffidence—for it is always an ungrateful thing to throw cold water on enthusiasms one sympathises with—but should 2*s.* a week pay a rent of more than 3*s.* a week? and will 3*s.* a week pay for all the conveniences which we are demanding that builders should supply? The experiments we have just been considering seem to answer in the negative. I desire, then, to point out that, if this conclusion is correct, any further building on the same lines by the municipality is subsidising low wages by paying part of rent—in other words, redistributing wealth by taxation. This may be right and admirable, or

it may not—I merely point out the fact. In conclusion, let me say that this—success or failure, as you like to consider it—points the moral which I have tried on several occasions to bring out—that he is still the benefactor of his race who makes two blades of grass grow where one grew before. If we are still so miserably poor that we cannot afford every man a decent home, it is time we were considering if the better distribution of wealth is the only question of any importance. Perhaps the most pernicious heresy in popular economics of the present day is the idea that there is wealth enough and to spare somewhere, and that it can be got by simple insistence on a higher wage. Our working classes as well as our idle classes must do their share in growing the second blade. If an eight-hours day will give as much as one of ten hours, if forty shillings will give us twice as much as twenty shillings did, if trade union restrictions will make every workman a better workman, let us have the shorter day and the higher wage and the trade union. But in the face of the figures of national income which I have presented, it is folly to think that there is any way of securing every man a decent house but by a very great increase in the wealth-production of the community.

THE LONDON COUNTY COUNCIL’S WASTEFULNESS.

THE discussion on the report of the works committee was resumed on Friday, the 23rd inst.

Mr. Lloyd said he regretted that there had been so much friction between the architect’s department and the manager of the works department. The members of the Council ought to do what they could to lessen that friction. The works committee had perhaps taken too much upon their shoulders, and they had had to do it under considerable disadvantage. He was not at all sure that they had not made a mistake in not at the outset placing at the disposal of the committee a capital sum of 100,000*l.* They ought to wait a little to see how things would turn out, and he believed it would be found in a year or two things would prove very satisfactory to the Council. He was quite sure that the work would be done better than work had ever before been done by a great public body.

Mr. John Burns, M.P., maintained that this outcry against the works committee was raised for electioneering purposes. He had found it necessary to incur 260*l.* for libel and slander, and the cases had not yet come off, but that would not deter him from resorting to bold, truthful, plain statement,

ENLARGING AND MAGIC LANTERNS.

“OPTIMUS” ETHO OXYGEN SAFETY SATURATOR.

Price complete with Jet, 70 - each.

FREDERICK E. IVES, of colour photography fame, said in a recent address:—“In my opinion the best of these inside-lantern Saturators yet produced is that of Perken, Son & Rayment, of London. . . . It will not become unduly heated in the lantern, as some of the others might, and is a model of compactness and convenience. I think so much of it that I have adopted it for my own use.”

“OPTIMUS” 100 CANDLE-POWER LAMP.

Price, Three Wicks 2 in. wide, with Lantern complete, 65- each.

Nature.—“Lanternists will be glad to learn that Perken, Son & Rayment have introduced a new oil lamp, possessing THREE TIMES THE CANDLE-POWER of those hitherto used for lantern projection. For small audiences the lamp will suit a lecturer’s purpose quite as well as the limelight.”

in order to nail down misrepresentation and calumny, which were spending themselves before the election on the head of the works committee. The result of their business for the year was that on an estimated outlay of over 66,000*l.* only 63,000*l.* had been expended. The Council had been forced into the establishment of this department in consequence of contractors refusing to do their work and withdrawing tenders after they had been opened. In his opinion the works committee would never be able to make a large profit, and if subjected to pettifogging red-tape restrictions by the architect's department it must be a failure. There was no subletting, except in one or two cases where the committee asked to be allowed to sublet when they were not ready to go on with the work themselves; trade union wages had to be paid and were paid, and that represented a considerable increase in the price of work, and builders and contractors were beginning to feel the pinch of them; better work was done than under the old conditions; there was no scamping, and keener supervision. Even a loss would have been justifiable in the interests of the higher wages they had paid and had been compelled to pay and the good work they had done, and in the name of London, and for the future of London's architecture, they intended to act in spite of the contractor and for the benefit of the ratepayers.

Mr. Beachcroft noticed that the works department and the works committee felt very uncomfortable if anything in the nature of criticism was levelled at them. It might be said that it was premature to criticise the works department; he considered it was better that that criticism should take place now than that it should be attempted when too late to be worth anything. He was interested in the housing of the working classes, and the works committee would be entrusted with works of the value of some 600,000*l.* At present they had in hand building operations in Yabsley Street, Poplar, for which the corrected estimate was just under 16,000*l.*, and the actual cost 1,200*l.* more, and West View Cottages, Greenock, for which the corrected estimate was 29,336*l.*, and the actual cost exceeded that amount by 6,000*l.* In the latter case that meant a loss of 20 per cent. If the committee kept a profit and loss account like any ordinary contractor, they could tell at once how they stood without having to wait eighteen months or more before they knew whether they were working at a profit or a loss. There were two other works about to be undertaken by the committee amounting to an aggregated estimate of 490,000*l.* If they were to lose 20 per cent. on these big jobs

there would be a loss of 100,000*l.* to the ratepayers. If this loss were to go on the Council would never stand it. Rather than go on with any extravagant department they ought to give it up, for local bodies, not only in the Metropolis but throughout the country, were watching this experiment. The Council would be judged by its works, and he was anxious lest the Council should be condemned. The Moderate party believed the time had come when criticism should be levelled at this department, and when proper safeguards should be taken to prevent excessive expenditure.

Mr. Arnold thought it was too early yet to criticise the works committee and say whether the department they had set up was a success or failure.

After some further discussion, Mr. Ward, the chairman of the committee, replied. He pointed out the difficulties under which they had worked in the first year of their existence, and said they would continue for the next six or nine months until they had got their yard in order. Their establishment charges had amounted to 9½ per cent., but now they would be able to reduce them to 5, and perhaps 4½. The engineering work, he contended, was of the very highest class, and the quality of the building work was also superior. He trusted the Council would be fair to the works committee. They had had a very hard time of it. Several of them had given a good deal of their time and a great deal of their experience to make it a success, and he thought they had made it a success. They ought not to be judged by one single job; the Council could only judge of the thing as a whole, and, judged as a whole, the gain was 3,000*l.* Even if they had not made it a success he appealed to the Council to give them time until they could make a fair trial of the department. He admitted that the jobs to which Mr. Beachcroft had referred were going to be losing jobs, but the committee had others in hand upon which they would make considerable profit.

The amendment that the paragraph in the report relating to works should not be received was negatived, and the report received.

The committee further recommended that it be referred to the general purposes committee to consider and report as to the advisability of framing some standing order which will provide for the approval of the Council being obtained to the ascertained cost of works executed by the works committee.

Mr. Lemon moved the following amendment:—"That the following be added, 'And also provide that in carrying out any work the works committee shall not be at liberty to exceed

the estimated amount of the cost except after a vote of the Council taken upon a recommendation submitted by the committee for which the work is being carried out approving the additional expenditure." Each committee entrusting work to the works department ought to know how it stood. The parks and open spaces committee had suffered considerable inconvenience through estimates which had been accepted by the works committee being exceeded, he was sorry to say, in all cases in which they had received complete information from them. There should be some means devised whereby, when work was handed over to the works committee on an estimate which they themselves had expressly approved, they should not exceed it without the sanction of the Council and intimation to the committee for which the work was done.

Mr. Campbell seconded.

Mr. Ward said that if the mover and seconder of the amendment had been practical men they would never have moved or seconded such an amendment. Perhaps they did not appreciate that the works committee did not and could not know until long after the work was completed how much it had cost.

Lieutenant-Colonel Ford and Mr. Antrobus having spoken, the amendment was negatived.

Mr. Westacott afterwards moved, and Mr. Fletcher seconded, that the following be added:—"And also provide that each committee, on whose recommendation any work shall be given to the works committee shall, in the event of the estimate being exceeded, report the same to the Council, with particulars of the amount by which it has been exceeded and the reason thereof, so that the Council may have the whole facts before them."

This amendment was also rejected.

The parks and open spaces committee also presented a report with reference to this subject, in which they complained that the estimates for works which had been entrusted to the works committee had been greatly exceeded. They submitted a list of seven works, the estimates of which amounted to 4,142*l.*, but which had cost 5,697*l.*—an excess of no less than 37 per cent. For the purpose of satisfying themselves that the estimates of their officials were reliable and reasonable, they had had prepared a return of all the works carried out for them by contractors, under the architect's direction, since May 1889. This return showed that eighty-two works had been so carried out, the estimates for which amounted to 52,138*l.*, while the total cost was only 48,722*l.* Under the circumstances the

committee thought they were justified in calling the special attention of the Council to the fact, as they were under the necessity of asking for an additional amount of 1,555*l.* in respect of the seven works enumerated by them.

Mr. Beachcroft moved, Mr. Fardell seconded, to add the following words to the recommendation:—"But that, in view of the facts above stated, it is desirable that a profit and loss account on works executed by the works committee should be forthwith established by the Council, fed when occasion requires out of the consolidated fund, and that it be referred to the finance committee to consider and report as to the establishment of such an account."

Mr. Ward said the works committee would agree in the principle of a profit and loss account if it could be legally established. A general reference to the general purposes committee as to its advisability would be accepted.

The amendment was negatived, and the recommendation of the committee approved.

FIRES IN THEATRES.

(Concluded from last week.)

WE have now gained a sufficiently clear understanding of the causes of fires and panics in theatres to enable us to turn to the second part of our subject, viz., the prevention of theatre fire catastrophes.

The principal measures for the prevention of theatre fire disasters should have in view, first, the safety of the people in the theatre, whether spectators, actors, stage hands or firemen on duty, and next, the safety of the building. The safety of the people comes first in the order of importance. The building may even burn down, but the public must under all circumstances have facilities for saving themselves. All efforts must be directed towards making the play-goers, the players, and the theatre employes safe. All manner of danger arising from a fire or from a panic, caused by a real or false fire alarm, should be averted, and appliances for saving life should be kept within reach. Next, the building should be made structurally safe, and efficient means for fire extinguishment should be provided, thus preventing the immense fire loss usually caused by a theatre conflagration.

The safety measures, to be briefly considered hereafter, may be divided into four principal groups, viz.:—(a). Measures to prevent outbreaks of fire, which include rules of theatre man-

THE MOST PERFECT AND RELIABLE SYSTEM OF

VENTILATION AND HEATING FOR SCHOOLS, AND EVERY CLASS OF BUILDING.

The air of Class-rooms renewed every six minutes in all weathers positively and without draughts, no foul air anywhere; for a school of 1,000 68 tons weight of air impelled into it every hour. All buildings ventilated and warmed mechanically. No failures nor breakdowns.

Estimates on Shortest Notice.

Low Working Expenses.

WILLIAM KEY, Ventilating and Heating Engineer, Central Chambers, 109 Hope Street, GLASGOW.

agement, regular systems of inspection; considerations of plan, size, location, and construction of a theatre, height of building and number of galleries, and structural details. (b). Measures to localise fires and to prevent their spreading, if in spite of precautions they do break out. Under this heading would come the fire walls, the fire doors, the fire curtain, the floor and roof construction, and the division of the theatre, horizontally and vertically, into many separate fire risks. (c). Measures to insure the safety of the spectators and of the stage people, to prevent injuries resulting from a jam or crush and a panic, the suffocation by smoke and death by fire. This group includes ample means for safe, easy, and quick exit from the burning building, and relates to such subjects as seats, aisles, passages, doors, stairs, and exits. It also embraces the questions of lighting and of ventilation, provision of stage ventilators, and special safety appliances, such as thermostats, automatic fire alarms, &c., telegraphic communication with the fire department, &c. (d). Measures to put out fires, which include all fire appliances, the stage sprinkler system, &c., a good, plentiful water service, &c.

1. To begin with, the theatre building should be isolated as far as practicable. Then, there should be in every theatre plenty of wide, well-arranged and well-distributed exits, leading the audience as quickly as possible to outdoors, and thereby decentralising the crowd. There should be separate and numerous fireproof stairs, at least two for each tier. For the stage and its accessory departments provision should be made for at least two independent exits. Fireproof stairs for the workmen should lead from the rigging loft down to the stage floor. The fire at the Opéra Comique, Paris, taught a good lesson in pointing out the necessity of having proper means of escape for the performers and workmen on the stage, which sometimes number as many as three or four hundred people. Where the theatre is not standing free on all sides, there should be wide courts on both sides and additional safety exits from the auditorium to the same, including suitable fire escapes from the balcony and upper galleries. Much the best plan, where the dimensions of the lot permit, is to have wide fireproof terraces, foyers or colonnades adjoining the corridors in each tier, which form places of safety for the audience in case they have to leave the theatre suddenly. All halls, corridors, passages, stairs, exit doors, courts and exits should be free from all obstructions. All exit doors should open outward. Exits should not be reduced at any point, but if possible should widen outward. There should be

plenty of wide aisles without steps, and no chairs or campstools should be permitted in the aisles. It is particularly important that there should be a sufficient number of stairs and plenty of exits for the occupants of the galleries, who, as the fire catastrophes described amply prove, are more endangered than the other spectators. Those who pay twenty-five cents admission fee have surely the same rights to safety as the occupants of three or five dollar seats, and in a place of amusement, to quote the words of the Rev. Dr. Duryea, spoken at the funeral services for the victims of the Brooklyn Theatre fire, "the poor should be made as safe as the rich."

Stairs from different tiers should not communicate together, nor should streams of people cross each other on their way out. All stairs should be provided with handrails on both sides; winding stairs and single steps should be avoided.

The provision of proper exits (including in the broader sense of the word aisles, corridors, stairs, doors), is by far the most important safety measure, both for fire and for panic. In fact, if properly carried out, it will save the lives of people even where all the other precautions are neglected. The aim should be to arrange the exits so that a theatre can be emptied without the slightest difficulty in from two to three minutes. Much will depend upon the available site, and upon the plan of the building.

If only plenty of exits are provided, so that, under all circumstances, the whole audience, even when frightened and suddenly thrown into a state of high mental excitement, can leave the building inside of two or three minutes, the fire-resisting qualities of the building are of less consequence, as regards the safety of the persons in the theatre. In fact, a theatre inferior in point of construction, but having exits as above described, would be safer than one built thoroughly fireproof, but otherwise not well arranged and not provided with sufficient stairs and exits, and where, therefore, in case of a false or real alarm of fire, or a panic from any cause, the people would be necessarily in grave peril.

2. Recognising, from the lessons taught by past theatre fire catastrophes, that the stage is the chief point of danger, it should be the aim to completely isolate this part of a theatre. Fire-walls should separate the stage from the auditorium on the one hand, and from the dressing-rooms and theatre offices on the other. The fire-wall dividing the auditorium from the stage, in which is located the large proscenium opening, should have as few other openings as possible, and none at all above the level of the stage. All openings should be kept closed by

SHORLAND'S PATENT COMBINATION OPEN FIRE-PLACE MANCHESTER STOVE

Made in various Designs and Sizes, with Tiles or Iron Sides, Single or Double Fronted, and with Ascending or Descending Smoke Flue.

Very largely used in HOSPITAL WARDS, for which the down-draught arrangement, as now shown, is specially suited.

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered. They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.

N.B.—Please note that all our goods, as advertised above are labelled, either inside or outside with our Trade Mark—"The Anchor."

fire-doors. The proscenium opening should be fitted with a fire-resisting curtain, closing as nearly as possible hermetically. The chief object of the curtain is to localise a stage fire and to cut off the fire, smoke, and the view of the fire during the retreat of the audience. It thus serves to restore confidence, and will often help to avoid the usual panic and jam. The fire-curtain should be able to withstand the increased air pressure due to the heat sufficiently long to enable the audience to make its escape. Whether the curtain be of corrugated iron or of asbestos, it is important that the apparatus for lowering the same be located on the stage, and not in the rigging loft, which place very soon becomes inaccessible when a stage fire breaks out.

3. Smoke and fire gases being the chief cause of death of the victims of theatre fire calamities, it is essential that large smoke ventilators or ventilating skylights be fitted up over the stage in order to remove the smoke at the highest point of the stage roof. Incidentally the stage ventilators tend to create a current of air from the auditorium towards the stage, and thereby prevent smoke, flames and suffocating gases from escaping into the auditorium. In this connection the abolishment of the usual central chandelier and ceiling vent in the auditorium is important. All ventilating registers for the auditorium should have dampers which are controlled and can be closed from the stage. This measure will tend to prevent the suffocation of the people in the upper gallery in case of a fire.

4. The study of the causes of theatre fires having shown that open gaslights in the vicinity of stage scenery and settings are the most prolific cause of fire, it is obvious that the stage and the scenery can be made much safer by fitting the same with incandescent electric light. All open lights, and gaslights in particular, as well as all sources of heat, should be eliminated from the stage. Incandescent electric light constitutes a brilliant, uniform and easily regulated light. It has not only the advantage of being much safer as regards danger from fire, but it is superior also because it does not vitiate the air, because it creates much less heat than gas, and because it does away with the dangerous lighting up of gas flames, which has been the cause of many a fire. In short, the electric light in theatres has all the advantages of gas without any of its inconveniences and dangers. But if gas-lighting must be used, the gas-piping should be most carefully done, all open flames should be well protected, the gas-meters set in a safe place, and the best available electric spark or flash-lighting system should be installed

for lighting up. In addition to the regular system of lighting, whether by gas or electricity, there should be provided in the corridors, stairs and exits auxiliary lights, either candle lanterns or oil lamps burning vegetable oil, to make the retreat of the people safer in case the gas is turned off or in case the electric light fails. The central gas chandelier in the auditorium, moreover, should be abolished.

5. To increase the safety of the stage still further, it is imperative to insist upon the fireproof treatment of all stage woodwork by the application of fireproof paint, and likewise upon the chemical impregnation of all gauze scenery, draperies, furniture and costumes, to render same unflammable. A further step forward in the right direction consists in the employment of light sheet iron frames or of wire-cloth netting, or in the use of asbestos for scenic decorations. Improvements in the stage machinery, such as the use of hydraulic power for raising and lowering traps and scenery in place of wooden hoisting drums and hand labour, the substitution of steel wire ropes in place of hemp cord, the entire abolishment of borders and wings, are much to be desired, all of which tend to make the stage safer. These are not merely theoretical suggestions; they have, on the contrary, proved eminently practical in actual use. The improvements recommended are largely due to the Asphaleia Society of Vienna, Austria, whose system of stage construction and stage machinery has been successfully used at the theatres of Buda-Pesth, in Austrian Hungary, at the People's Theatre in Vienna, at the Halle Stadt Theatre in Germany, in the Victoria Theatre in Sydney, Australia, and in the new Auditorium Theatre in Chicago.

The accumulation of much scenery or scenic decorations on or near the stage should be avoided, and not more scenery should be hung than is needed for two performances. Neither the auditorium loft nor the cellar under the auditorium should be used for the storage of scenery. Want of order on the stage is sometimes due to lack of store-room or to an insufficient number of stage hands.

6. In the construction of the theatre building fire-resisting materials should be preferred, and unprotected ironwork, granite and limestone should be avoided. The building should be divided into a large number of separate fire risks, both horizontally and vertically. The stage should be completely isolated by fire walls carried above the roof; all dressing-rooms should be made fireproof, and the whole auditorium and each of its tiers, corridors and stairs should be constructed in a fire-resisting manner.

GOLD MEDAL, Inventions Exhibition, 1885.

7. All scene docks, workshops, carpenter and paint shops should be banished from the theatre building and placed in a separate fireproof annexe. The heating apparatus, the dynamos of the electric-light plant, the fire pump and the gas-meter should be located in fireproof vaults, preferably under the sidewalk, but not under the stage nor under the auditorium. No living or sleeping apartments or stores should be located in the theatre building, and no dangerous trades should be carried on in the same.

8. In order to put out a fire in a theatre before it can gain headway, there should be provided an abundant supply of water under fire pressure and plenty of efficient fire-extinguishing appliances, such as one or more fire pumps, fire stand-pipes, fire valves, hydrants, monitor nozzles and fire hose; a large number of fire pails, casks of water, chemical fire extinguishers, fire axes, fire hooks on poles, wet sheets, wet sponges on long poles, &c. The whole stage should, moreover, be protected by an automatic sprinkler system, supplied from a large fire tank on the highest roof, and having also an outside fire departmental connection, to which the fire engines may be coupled. All the appliances mentioned are useful chiefly during the first moments of a fire, and wherever provided and kept in good order and in readiness for instant use, they have served to put out many a stage fire which, without them, might have resulted in a serious calamity. It is true, however, that as soon as the flames have spread in the majority of theatres as constructed until recently, the fire appliances would soon become powerless to subdue a fire.

9. Much care should be bestowed upon the heating apparatus for a theatre, for in not a few instances it has been the cause of a fire. A number of fires as sources of heat being out of the question on account of difficulties in attending to them, and also because they increase the fire danger, the choice lies between a warm air furnace, a steam and hot water boiler. Furnaces can only be used for theatres of small size, and in the majority of cases heating is done by steam. The usual precautions should be observed and the steam boiler placed in a fireproof vault, preferably outside of the theatre proper. It may with advantage be combined with the electric-light plant.

10. Efficient lightning-rod protection adds to the safety of a theatre building, and in European theatres its installation is generally included in the equipment of the building.

11. It is quite important to have on hand in every theatre, for cases of emergency, a few life-saving appliances, such as

rope escapes, a jumping-net and a cloth chute, to aid in saving persons in case their retreat from the upper floors should be too suddenly cut off by fire or smoke.

12. Finally, it will be a great help in preventing theatre fires if a fire watch is kept in the building day and night, reinforced during the hours of the performance by detachments from the city fire department. Nothing will increase more the security of a theatre than frequent inspections. There should be a telegraph connection with the nearest fire department station, and automatic fire alarms at many points in the building, which should be frequently tested to make sure that they are in good working order. There should also be speaking tubes, electric-bells and telegraph alarms, to bring all parts of the building into communication with each other. And lastly, the theatre employes should undergo regular fire drills, so that in case of an emergency each employé will know what duty he has to perform.

13. Many of the safety appliances spoken of can be arranged so as to work automatically. Such automatic appliances are good in their way and some of them have proved in actual experience to be quite efficient. They should not, however, be solely relied upon and in general it will be better not to trust to automatic appliances altogether. The automatic fire alarm system and the automatic sprinkler system may be approved, but the automatic sliding skylights or the smoke ventilators over the stage roof and the automatic fire curtain may fail to work properly when needed. I am quite aware of the fact that others argue in favour of automatic appliances, claiming that one cannot rely in moments of danger upon the coolheadedness of men, and that in a panic every one will think of his own safety first and theatre employes will forget their duties.

But in my judgment it is infinitely better to put all such appliances in charge of a special, reliable "safety officer," who may be a trusted fireman, whose sole duty, in case of an outbreak of fire, should be to lower the fire curtain, to open the stage ventilators, to close the auditorium ventilating registers, to send the alarm to the theatre engineer who runs the fire pump and to the nearest fire-engine station, to notify the audience promptly that they must disperse quietly, to see that the gas is not shut off and that the auxiliary lights are kept burning, to see that all doors leading to the stage are kept closed to prevent a draught, and who should order the water turned on at the fire hydrants, the monitor nozzles and the perforated pipe system, where such is installed in place of automatic sprinklers.

CHANGES IN THE SCOTTISH IRON INDUSTRY.

OF late years the iron and steel industries in Scotland have undergone, says a correspondent of the *Scotsman*, some remarkable and revolutionary changes. The pig-iron industry was substantially founded on the discovery of the Blackband ironstone of the western part of the country, although one or two works—including those of Carron, which were founded about the middle of the last century, and were for many years engaged in the manufacture of the type of ordnance known as carronades—had been established before that. A turning-point in the career of the Scottish pig-iron trade was the discovery and application of the hot blast by Neilson, and another landmark was the construction of the works of Gartsherrie by the Brothers Baird in 1830. This firm did a great deal to extend the pig-iron industry, and acquired or erected one establishment after another until they had forty-two blast furnaces under their own control, thirty of which have been in blast at one time. No other firm in the history of the iron trade ever owned such a large number of furnaces at one and the same time, but it is a striking indication of the changes that have since then overtaken the iron industry that while the most that the Messrs. Baird ever produced from the whole of their plants was 800 tons per day, or 240,000 tons a year, this large quantity is no more than would now be produced by two and a half or three furnaces of the most modern American type. Twenty years ago the Messrs. Baird claimed to be the largest pig-iron makers in the world, and Scotland was no doubt duly sensible of the importance of the claim; but it is long since any Scottish firm enjoyed this distinction, and at the present time the works of Carnegie & Co. in the United States produce more than three times the largest quantity that even the firm of W. Baird & Co. ever produced in a single year.

The course of the pig-iron industry of Scotland continued to be pretty even and prosperous up to the year 1860, when the output of pig first reached 1,000,000 tons. It had grown to this figure from only 475,000 tons in 1845, and from 825,000 tons in 1855. When, however, the output had attained 1,000,000 tons a year, it appeared as if it could only go further with difficulty. From that time forward the production became subject to considerable oscillation. The maximum output of any one year was attained in 1870, when the quantity produced was 1,206,000 tons; but it fell to considerably less than this amount in the years 1873 and 1874, when the prices of pig were the highest on record, and when, therefore, there was every

inducement to get out the very largest quantity possible. Two causes appear to have operated to produce this result. The first of these was the difficulty experienced in procuring adequate supplies of fuel, which had not only reached a prohibitory price, but had become exceedingly scarce, owing to the miners having adopted a policy of restricted output. The second was the increasing scarcity of the special Blackband ores, on which the superstructure of the Scottish pig-iron industry was originally founded. This latter influence has since then retarded the growth of the Scottish pig-iron trade, and prevented it from again attaining the high water mark of output which was reached in 1870. Up to 1880 the output of iron ore in Scotland was generally over 2,500,000 tons a year, but from that date the production of indigenous ores commenced to decline until in 1890 they had fallen to less than 1,000,000 tons, and they are now considerably less even than that figure. Meanwhile, however, a new demand had arisen which the pig-iron makers of Scotland had to set themselves to meet. About 1878 the open hearth industry was established in Scotland, and this industry called for a quality of pig-iron that the Scottish works were not then producing, namely, Bessemer or hematite pig. The void was soon filled. The ores of Bilbao had then come into some prominence for the requirements of South Wales and other districts. Scotland began to import Spanish ores also, and increased the production of hematite iron year by year, until nearly one-half of the whole output assumed this form, the product of ores that had to be imported from mines something like a thousand miles away. To this extent Scotland became a direct competitor with the west coast works and with the South Wales pig-iron makers. But even with this new branch of industry to fall back upon the trade did not appear to increase.

The hematite iron now produced did not supplement but took the place of the so-called Scottish iron formerly made, until the output of the latter fell to less than 500,000 tons a year, and considerably less than one-half of what it had been only a few years before. This decline was not wholly due to the considerations already stated. There were other influences at work of a more technical character, and more especially the scientific advances that enabled continental consumers, who had previously depended on Scottish pig for foundry mixtures, to dispense with it for that purpose. There was, moreover, the keener competition to face of other British iron-producing districts, and of Cleveland in particular, and it is not improbable that the

partiality that formerly prevailed in most of the leading countries of the world in favour of Scottish foundry brands had become lost, as they found out that they could get along without Scottish iron and find themselves little or none the worse. At any rate the Scottish branded ironmakers found it more and more difficult to dispose of their produce at the prices formerly obtained. Up to the end of 1877 it was a rare thing to find Scottish branded iron quoted or sold at less than 55s. per ton. Only three or four times—and then in the gloomy period 1859-61—had Scottish warrants fallen under 50s. Between 1848 and 1857 the average price of such iron was over 70s. per ton, and omitting, as being altogether exceptional, the eventful years 1872-73, when Scottish pig-iron averaged 101s. 10d. and 117s. 3d. per ton respectively, the general range of prices was such as to leave very satisfactory profits. During the last ten or twelve years, however, all this has changed. The average price of Scottish pig-iron warrants has generally fluctuated between 43s. and 46s. per ton, or at least 10s. per ton less than the average of comparatively recent times. This decline of prices has coincided with a higher cost of production for both iron ores and fuel, while there is no reason to believe that the Scottish ironmasters have of late been better treated by the railway companies. The limited amount of profits now earned in the making of Scottish pig-iron may be indicated by the fact that during the miners' strike in the Midlands, in the autumn of last year, many of the Scottish blast furnaces were blown out, in order that the supplies of coal might be temporarily diverted to the manufacturing districts of England that were prepared to pay a few shillings per ton more than the normal prices.

CRYSTAL PALACE CYCLE SHOW.

THE Metropolitan Machinists' Co, Limited, will show among others the following 1895 patterns of the well-known Juno cycles at the Crystal Palace (December 6 to December 11):—The Juno racing safety fitted with hollow rims, tangent spokes and racing Dunlop pneumatic tyres; also improved detachable crank chain wheel, permitting another to be quickly substituted and thereby either increasing or diminishing the gear at will. This machine is exquisitely finished in plain black enamel and plated parts, and scales only the wonderfully low figure of 21 lbs. Another specimen of the Juno racer, 22 lbs. in weight. A Juno light roadster, Dunlop pneumatic tyres and the new improved wood rims. The scale weight of this machine is 25 lbs.,

including detachable crank gear wheel. A Juno light roadster, 28½ lbs. in weight, otherwise a similar machine. A Juno road racer, 28 lbs. only, including non-slipping cover to the back wheel. Several specimens of the Juno lady's safeties, 28 lbs. only in weight, strong and light in build. The Juno juvenile safeties and the Juno folding tricycle, of the latter (1895) an admirable machine. Several improvements in detail of the build of the (1895) Junos should be noted—detachable chain wheels, permitting alteration of gear with quickness and ease; reduction in the width of tread, bringing the rider's feet closer together and affording increased power. The weight of all grades of Junos has been further reduced without infringing on the rigidity of the machine.

PATENTS

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 21792. John Thomas Lane and Frederick Albon, for "An improved locking-bar for doors, gates, &c."
- 21876. John Whitehead, for "Improvements in bolts for fastening windows, doors, gates and for other such-like purposes."
- 21904. Stansbury Jacob Smith, for "Improvements in gates."
- 21941. Henry Shepperd, for "Improvements in hollow walls."
- 22073. George Anthony Marsden, for "Improved construction of tiles."
- 22078. William Nicol, for "Improvements in and relating to ventilators."
- 22100. Alfred Julius Boulton, for "Improvements in and relating to damp-proof paints and the like."
- 22118. Samuel Webster Dean, for "Improvements in tiles."

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 P.M. on Thursdays.

SPECIALTIES—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c., &c.

ROBT. ADAMS'S Patent

Ventilating Apparatus for

Continuous Sashes of

Lantern Lights,

Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No. 208. Special thrust motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

TRADE NOTES.

MR. ROBERT ADAMS, of 67 Newington Causeway, S.E., has supplied and fixed his patent "Exodus" and "Exit" bolts to the panic and exit doors of the new Bishopsgate Institute.

THE modelled fibrous plaster ceilings at Thurland Castle, illustrated in our last number, were executed by Messrs. J. W. Elmes & Son, of 62 Sydney Street, South Kensington, S.W.

THE cold weather is once again setting in. We are pleased to inform our readers that Mr. G. Shrewsbury, patentee and sole manufacturer of gas conservatory boilers, the "Calda" instantaneous water heater for gas or oil, gas baths, new patent "Unique" gas ovens, &c., Station Road, Camberwell, London, S.E., is now introducing for the season a new gas boiler for heating hot-water pipes, of an excellent kind, which also will be found most useful as a gas conservatory boiler. It will heat 40 to 50 feet of 3-inch hot-water pipe. The boiler is reversible to suit either hand, and the burner swings out for safety in lighting. The boiler, which is small, compact, efficient and cheap, is adapted for fixing inside or outside the conservatory, being made on the patent "Reliance" principle. If fixed inside, the flue pipe should be carried through the roof, and fresh air (for supply of burner), brought from outside by a short pipe attached to nozzle at back of stand. If outside conservatory, it can be placed in potting-shed, or any convenient out-building or galvanised case as used for the patent "Nonpareil" boilers.

MESSRS. WILLIAMS BROTHERS & CO., 3 Broad Street Buildings, E.C., write us re our notice of work done at Edmonton Union. Instead of saying "patent ventilating opening gear," "patent ventilating warming gear" should have been inserted.

At the meeting of the Birmingham City Council a reduction in the price of gas was announced by the Corporation, who hold the undertaking. It was stated that the average price of gas was the lowest charged in the kingdom.

VARIETIES.

At the meeting of the Manchester Association of Students of the Institution of Civil Engineers, Mr. A. Ross, C.E., the president of the Association, in the chair, Mr. Henry Fowler read a paper on the testing and inspection of plates. He first dealt with the requirements of specifications as to the number of tests to be taken, and passed on to the tensile tests which are most important, giving the tenacity and elongation for

boiler, bridge and ship plates. He also mentioned in detail the behaviour of the test pieces as regards the elongation and contraction of areas. The value of bend tests and drift tests, and the method of conducting them, were described; the value of chemical analysis, the necessity of making crossway and lengthway tests, the appearances of the different fractures, surface examination, &c.

THE "Railway Diary and Officials' Directory for 1895," published by Messrs. McCorquodale & Co., Limited, London, is quite up to the usual excellent standard. It is further supplemented by a most useful railway almanack.

At the meeting of the Architectural Section of the Philosophical Society of Glasgow, Mr. T. L. Watson presiding, Mr. Thomas Gildard, architect, read a paper on "An old Glasgow architect and some older ones." The lecturer gave many interesting remembrances of those to whose genius and skill the appearance of the city was so much indebted. He mentioned the names of thirty architects, and alluded to their important works.

THE materials of the Kirkdale Gaol buildings have been sold by auction. The chaplain's house and cottage were sold for 125% ; the reception-ward, scaffold-house, warehouse, &c., for 265% ; the governor's house, 300% ; the women's hospital, 35% ; the men's hospital and yard, 105% ; the millhouse, cook-house, laundry and English church, 1,800% . A sum of 2,630% was realised, apart from the price of some stone setts.

BUILDING AND BUILDERS.

THE new cemetery at Altrincham was opened on the 21st ult. by the Mayor. The cost has been 9,000% . The chapel is in fourteenth century style. The works have been carried out under the superintendence of Mr. Wm. Owen, architect, Manchester. Mr. John Matthews, of Nantwich, was the principal contractor; heating, Mr. James Smith; mosaic floor, &c., Messrs. J. & H. Patteson; stained-glass, Mr. James Jones; entrance gates, &c., Messrs. Cunliffe & Dean; boundary wall, Mr. J. H. Holt.

THE new Conservative Club, Glasgow, just opened by Sir E. Clarke, has been erected at a cost of 33,000% , exclusive of the site, and is considered the finest building of the kind in Scotland.

At the holding of the Govan Dean of Guild Court the application of John Grant Sharp, Glasgow, for lining to erect

several tenements of dwelling-houses in Sharp Street was granted.

IN connection with proposed building operations at Hanley, the purchase of land for the erection of dwellings for the working classes is contemplated. It is also suggested that a turret should be built in connection with the pavilion in the Park for the large clock, a gift promised by Messrs. Pidduck.

A HOUSE for private patients is about to be commenced at Garlands, Carlisle. This is part of a scheme for providing accommodation for paying patients, consisting of a central main administrative building and a series of houses on either side. An excellent site has been chosen in the asylum grounds. The designs are being prepared by the county architect, Mr. Geo. Dale Oliver, Lowther Street, Carlisle.

THE Berlin City Council have authorised the health committee to have erected a boundary wall for the new fever hospital at Yardley, the estimated cost of which is 3,000*l*.

MESSRS. CHESSUM & SON'S tender, amounting to 32,266*l*., for erection of new offices of the Commission of Sewers in Basinghall Street was accepted on Monday.

ELECTRICAL.

AMONG the private Bills submitted for consideration at the next meeting of Parliament thirty-one are concerned with projects for electric lighting.

AN inquiry has been held at Fleetwood with regard to the Improvement Commissioners' application for borrowing powers for the proposed electric-lighting scheme. The proposals of the Commissioners include a complete system of street lighting. The scheme was opposed on behalf of the railway companies, who urged that the sewerage and other questions were much more pressing.

AT the meeting of the Hanley Town Council it was reported that a correspondence had taken place with the Brush Electrical Engineering Company as to the character of the plant and apparatus supplied by them at the Hanley Electricity Works. The company stated that it was their desire that the equipment of the works should give entire satisfaction, and they agreed to a proposal to send one of their engineers to supervise and be responsible for the running of the plant for a month in order to demonstrate what they believed to be the fact—that the plant was in good working order.

"OPTIMUS" SAFETY SATURATOR.

MESSRS. PERKEN, SON & RAYMENT write us:—The researches of scientists pursued during many years for a portable substitute for hydrogen gas to be used in conjunction with oxygen under pressure has resulted in the invention of the saturator, which will produce limelight by the aid of etho-oxygen. The saturator is exceedingly small, being only 6 inches long by 3½ inches wide by 1¼ inch deep; into this some eight or ten ounces of ether are poured, and absorbed by a specially non-inflammable packing. Oxygen under pressure is passed through the saturator, and by means of a blow-pipe or jet heats a lime cylinder to incandescence, giving a most brilliant light, eminently suited for the optical projecting lantern. For this purpose it has been most successfully employed for instruction and entertainment. The Rev. Archdeacon Shears, according to the enclosed testimony (see letter below), appears to have formed a high opinion of the "Optimus Saturator" manufactured by ourselves. This is no doubt a subject which at this season will interest many of your readers, and we shall be glad if you will insert the Archdeacon's letter.

Messrs. Perken, Son & Rayment.

Gentlemen,—I have tried many experiments with several saturators for optical lantern projection . . . and have come to the conclusion that the "Optimus" is by far the best. . . I never now use any other. . .

The grounds of my preference are:—1. Safety. I believe your "Optimus Saturator" to be perfectly safe. At one time I doubted this, therefore submitted it to very severe tests. If I try my utmost to get an accident I do not know how to accomplish anything worse than to damage the apparatus itself. If the operator will keep the saturator well supplied with ether and oxygen any mishap whatever seems impossible. 2. The jet is separate from the saturator. 3. For brilliancy of light obtained with perfect silence I believe your saturator to be unequalled. I use the "Optimus Saturator" with an objective of 2-inch diameter and 15-inch focus, and can get perfectly illuminated pictures at any practical distance.

(Signed) ERNEST H. SHEARS (Archdeacon).

Newport Road, Stafford: November 9, 1894.

THE new hospitals, Gosport, are being warmed and ventilated by means of Shorland's patent Manchester stoves, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of 3½ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 1, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different source of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.

WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

FOR FURTHER PARTICULARS, APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.

14 Palmer Street, Westminster, London.

PORLAND CEMENT.

A MEETING of the cement trade was held at the London Chamber of Commerce on Nov. 30 for the purpose of receiving and adopting, or otherwise, certain recommendations of the special committee which has been appointed to investigate and report upon the extent of the practice of admixtures with Portland cement, and as to the justifiability thereof. The trade with only one dissident adopted the recommendation of the committee, that it was advisable that all manufacturers of Portland cement who have used any outside material or materials in the manufacture of that article should at once discontinue the practice. The use, however, of not more than 2 per cent. of gypsum, as practised by the German manufacturers for the purpose of regulating the setting of the cement, is considered optional.

L.C.C. CONTRACTORS v. L.C.C. WORKS DEPARTMENT.

THE following letter has been written to the Chairman of the London County Council:—

Sir,—Our attention has been drawn to some remarks made by Mr. John Burns at a special meeting of the London County Council on Thursday last. Mr. Burns is reported to have said that although the estimate of the Works Department of the L.C.C. had been exceeded in many instances, the Council had the satisfaction of knowing that the works executed by their Works Department were of a better quality than the works executed by the contractors under the old conditions.

The excess of the estimates we do not propose to discuss; but we consider Mr. Burns's statement as to the quality of the work not only misleading to the ratepayers of London, but absolutely devoid of foundation, and calculated to damage ourselves and other contractors.

We challenge proof of this statement, and would suggest that a committee of experts be at once appointed by the Council to verify it, in fairness to the contractors and ratepayers of London.

We give as specimens of the works executed by us the following:—The Private Lunatic Asylum at Claybury, dynamo house and electric-light station at Claybury, foundations for the artisans' dwellings at Yabsley Street, Poplar, and the artisans' dwellings known as Beachcroft Buildings, Brook Street, Limehouse, E.

If in the opinion of the suggested committee of experts these works are not equal in quality of materials and workmanship to works of a similar nature executed by the Works Department of the L.C.C., we are willing to hand over 50% to any hospital you may name.

We presume that—if you adopt our suggestion—the report of the said committee will be published, and as we consider the matter of great public interest, we are sending a copy of this letter to the Press.—We are, sir, your obedient servants,

REED, BLIGHT & CO., LIMITED,

(Signed) Per John Reed, managing director.

Albany Buildings, 27 Victoria Street, Westminster, S.W.

November 28, 1894.

The following account of his experience (which is not unique) in carrying out works has been furnished by a contractor to the *Standard*:—

I have recently carried out a contract for the London County Council, amounting to 16,000*l.*, and have had an opportunity of inspecting some work done by this wonderful body, and of seeing how they contrived. I do not hesitate to say that they use materials which they (through their architect) would not dream of allowing a contractor to use; and I am prepared to prove this up to the hilt, and if I fail I will cheerfully give 10*l.* to the Builders' Benevolent Institution. Take, for instance, a few of the materials, viz.:—

Bricks.—Local bricks submitted by me to the architect were rejected, and I had to supply Kentish bricks, at a loss to me of over 200*l.*, yet they are using these (local) bricks, and now consider them good enough.

Sand.—I was compelled to use Thames river sand, the local pit sand being rejected; they are using the latter.

Deals.—I had to use those at about 2*s.* per foot cube. I could purchase those they use at 1*s.* 2*d.* cube.

Oak.—To satisfy the architect I had to use oak that cost me 4*s.* 6*d.* per foot cube, yet that used by them I could obtain at 2*s.*; in most cases the posts have had to be reversed to get the required sizes above ground, so that the ends below actually taper.

Had I been allowed to carry out my work as they do it, my price would have been at least 10 per cent. lower, and the work would have paid me better.

Are the prime costs of the works committee burdened with the quantity surveyors' fees and lithography, and are clerical

and management expenses charged to each contract? I note that nothing is charged for depreciation of plant, which on a job of any magnitude would be a serious item. Taking all these things into consideration, coupled with the fact that the work done by them is not of anything like the standard described in their specifications, I should think they have made a bigger hash of this experiment than is even shown by their report, and the old saying, that "The man who is his own surveyor has a fool for a client" will, I think, apply in this case. Let me, at any rate, hope that in future they will be more magnanimously disposed towards builders undertaking their work, and not harass them in every conceivable way, both as regards captious fault-finding and by keeping them out of their money forty days after certificates are applied for and twenty-eight days after they are delivered.

BIRMINGHAM MASTER BUILDERS' ASSOCIATION.

At the annual meeting of the members of the Birmingham Master Builders' Association, held at the offices of the secretary, (Mr. E. J. Bigwood), Colmore Row, Mr. T. Barnsley, president, occupied the chair, and there were present Messrs. R. Bulley, J. S. Surman, T. Surman, J. Goodman, T. Johnson, J. Jeffery, R. Fenwick, E. Bates, W. Sappcote, A. S. Smith, J. Archer and F. G. Whittall.

The annual report stated that depression of trade still continued, but the progress of several large works in the city, notably the new General Hospital, the Technical Schools and the railway extensions, had provided a fair amount of work for the operatives in several branches of the trade. The year had been an uneventful one, no matter of importance having disturbed the amicable relations between employers and employed. The standing committee, with the representatives of the stonemasons and bricklayers, had met several times, and satisfactorily disposed of minor disputes. The committee, the report concluded, after carefully considering the matter, decided not to give notice to the operatives of any alteration in existing rules, and the same unwillingness to disturb the existing state of affairs appeared to have prevailed with the operatives, for no notice had been received from any branch. The membership of the Association numbered sixty-five. The statement of accounts showed that the receipts for the year had been 124*l.* 10*s.* 2*d.*, which, with the balance of 28*l.* 13*s.* 11*d.* from last year, made a total of

153*l.* 14*s.* 1*d.*, and there was a balance in hand of 64*l.* 11*s.* 8*d.* The report was adopted.

Mr. T. Barnsley was re-elected president, and, in thanking the members of the Association for the confidence again placed in him, expressed the hope that the affairs of the building trade would go on as smoothly during the present year as they had done during the past. As a trade they had to be thankful for the good weather which had prevailed, and as a result of which the workmen had been able to make almost full time. He hoped the open weather would continue till Christmas, and then there would be no distress amongst the workmen and their families.

The following officers were reappointed:—Vice-presidents, Messrs. T. Rowbotham and R. Bulley; treasurer, Mr. G. Twigg; auditors, Messrs. J. Bowen and T. Surman; secretary, Mr. E. J. Bigwood.

A vote of thanks was passed to Mr. Barnsley for his services during the year, and for presiding at the meeting.

ANTIQUE ART.

MR. ICHENHÄUSER is now showing at 52 Brook Street—his temporary premises during the rebuilding of his Bond Street Galleries—a really superb collection of *objets d'art*, embracing, as his card of invitation states, "old masters, old china, and old furniture." Among the first are some notable examples (all are in perfect condition) of Backhuysen (a fine view of Medieval Antwerp), the older and younger Teniers, the two Poussins, Vandyk, Lely, Wouvermans, Van Hooze, Van Lint (an interesting picture containing some forty or fifty contemporary portraits), and other equally famous old-time painters. There are some interesting early German triptychs and—which is specially worthy of inspection—a very fine series of panel pictures by early German masters forming the complete decoration of a chapel.

Among the china are a grand suite of richly decorated jars and beakers, some 5 feet in height, and many choice specimens taken from the Pekin summer palace, &c. The furniture comprises rare old cabinets, writing-tables, buffets, &c., in elaborately carved oak and other woods, some of German origin or from the Low Countries, and some dating from the best periods of French art, while an extensive array of equally highly wrought carved panels and doors complete and form an admirable background to the collection.

BEEHIVE INN, STOCKPORT.

THE PLUMBERS' COMPANY.

THE Company of Plumbers gave a banquet on Tuesday evening in the Goldsmiths' Hall, London, under the presidency of Alderman Sir Stuart Knill, the Master of the Company. Amongst the guests were the Lord Mayor of London, Mr. Sheriff Samuel, Dr. Thorne Thorne, of the Local Government Board; Mr. Diggle, of the London School Board; Mr. T. de Courcey Meade, city surveyor, Manchester, and many provincial mayors, chairmen of County Councils and medical officers of health.

Sir Stuart Knill, in proposing "The Municipal and County Authorities of the United Kingdom," said that the great work of plumbers' registration, and the work generally of that Company, had been accepted throughout the length and breadth of the land by municipal and other authorities as urgently necessary to nearly every town. The work of education, examination and registration was being well carried out.

Mr. Littler, Q.C., as chairman of the Middlesex County Council, responded, and expressed the belief that the action which was being taken by the plumbers was reacting beneficially on other trades, and tending to make them aim at a higher standard.

Sir Stuart Knill subsequently stated that twelve working plumbers had that day been admitted into the freedom of the Plumbers' Company, having passed first-class in honours in the City Guilds examination.

AFTER complete renovation, St. Matthew's Church, Little Lever, Lancashire, has been further embellished by the addition of a chancel screen in oak, and oak communion rails, both elaborately carved by Messrs. Earp & Hobbs, of London and Manchester, who have also erected a mural monument on the north wall of the chancel in memory of the late vicar. The work has been carried out from designs and under the superintendence of Mr. R. Knill Freeman, F.R.I.B.A., surveyor for the diocese.

NORTHERN ARCHITECTURAL ASSOCIATION.

THE following rules have been prepared for adoption by members of the Northern Association.

I.—Name.

1. The name of the Association shall be "The Northern Architectural Association."

II.—Objects.

2. The objects of the Association shall be to promote union amongst its members, the elevation of the profession of architecture, the establishment of uniformity of practice and professional charges, and the general advancement of the art and science of architecture.

III.—Constitution.

3. The Association shall consist of four classes of members, viz. members, associates, students and honorary members.

4. Members shall be architects in practice as principals, or as town or county architects, who have so practised for not less than three consecutive years immediately preceding their nomination.

5. Associates shall be architects in practice, but not yet eligible as members, or assistants (exceeding the age of twenty-one years) in the offices of gentlemen eligible as members or associates.

6. Students shall not exceed the age of twenty-one years, and be engaged in the study of architecture in the offices of gentlemen eligible as members or associates.

7. The Association may, on the recommendation of the Council, confer honorary membership upon gentlemen eminent for distinguished attainments, or who have rendered services to the Association or profession.

8. Members and associates only shall have the right to vote.

IV.—Election of Members.

9. Gentlemen desirous of being admitted members, associates or students must be nominated by two members or associates in the form annexed to these rules. The forms to be sent to the secretary who shall lay them before the next Council meeting, and if found in order, the names of the candidates and proposers shall appear upon the circular convening the next ensuing general meeting of the Association. The names shall again be inserted in the circular convening the following meeting, at which the voting shall take place by

HILL'S

SLIDING-DOOR GEAR

WITH STEEL AXLES AND GUN-METAL BEARINGS.

ballot, and one dissentient vote in five shall exclude; but no decision shall be come to unless at least six votes are recorded, failing which the decision shall stand adjourned to the next or following meetings.

10. Students desirous of becoming associates, or associates of becoming members, must again be nominated and balloted for.

11. The voting for honorary members shall be by show of hands.

12. In the case of the non-election of any gentleman, no notice shall be taken thereof in the minutes, and he shall not again be nominated to the same class of membership during the ensuing twelve months.

13. Every gentleman on his election shall be required to sign his name, agreeing to conform to the rules, in a book provided for that purpose.

14. If the Council shall have reason to consider that the conduct of a member has been derogatory to the Association, they may, after giving fourteen days' notice to him in writing, lay a statement before a special meeting to be called for the purpose, under rule 33, at which a vote by ballot shall be taken; and if four-fifths of the votes be recorded against him, he shall cease to be a member of the Association, but no decision shall be come to unless seven votes are recorded.

V.—Subscriptions.

15. An entrance fee of 1*l.* 1*s.* shall be paid by each member, and 10*s.* 6*d.* by each associate. Members elected from the class of associates shall pay 10*s.* 6*d.*

16. The annual subscription of members shall be 1*l.* 1*s.*; of associates, 10*s.* 6*d.*; and of students, 5*s.*

17. All subscriptions shall be payable in advance, and shall become due on January 1 of each year.

18. Every member shall pay his entrance fee and first annual subscription within two months of his election, otherwise such election shall be void; but members elected after October 1 in any year shall be exempt from the payment of their subscriptions for the following year.

19. All members shall be liable for payment of their subscriptions until they send written notice to the honorary secretary of their withdrawal from the Association; but when any member's subscription is two years in arrear, notice shall be given him in writing by the honorary secretary, and if the arrears be not paid within one month of the date of such notice, he shall thereupon cease to be a member of the Association.

VI.—Council.

20. The officers of the Association shall consist of president, vice-president, honorary secretary, honorary treasurer and honorary librarian, who, with five other members and two associates, shall form a Council for the direction and management of its affairs. The last retired president and each honorary local secretary shall be *ex officio* members of the Council. Four to form a quorum. There shall also be an honorary solicitor, appointed annually by the Council.

21. The officers and Council (except *ex officio* members) shall be elected for one year, by ballot, at the annual meeting. Nominations to be sent to the secretary at least three weeks previously. A list of such nominations to be issued to each member and associate, along with the notice convening the annual meeting, and the voting to be by means of such lists returned (under cover to the secretary), at or before the annual meeting, the members voting by the erasure from such list of the names of those for whom they do not vote. Two scrutineers to be appointed at the annual meeting, to open and examine the voting papers, and to report the result of the elections thereat. In the event of any member being elected for more than one office, he shall be deemed elected to the higher in the order of precedence named in rule 20.

22. The president and vice-president shall not be eligible for re-election to the same office for more than two consecutive years. The other members of the Council shall be eligible for re-election, with the exception of the two whose attendances have been least during the session, equality in the number of attendances to be decided by drawing lots.

23. The president, or in his absence, the vice-president, shall preside at all meetings, but in their absence the members present shall elect a chairman. In case of an equality of votes on any question the chairman shall have the casting vote.

24. The secretary shall have charge of all the property of the Association, except the funds and the library. He shall take minutes of all meetings, and manage the general correspondence and business of the Association subject to the direction of the Council.

25. The treasurer shall have charge of the funds of the Association, and shall receive and disburse the same subject to the direction of the Council. He shall present an audited account at the annual meeting.

26. The librarian shall have charge of the library, subject to the direction of the Council.

27. The Association may, on the recommendation of the

Council, elect annually from among its members honorary local secretaries for towns or districts at a distance from Newcastle; they shall communicate with the Council on any matters affecting or of interest to the Association occurring in their respective localities.

28. One member and one associate shall be appointed at the annual meeting to audit the accounts of the Association for the ensuing year.

29. Vacancies occurring during the year to be filled as the Council may appoint.

VII.—Session and Meetings.

30. The session shall commence in November of each year, and meetings be held in each month up to and including March, the following year. The annual meeting shall be held in March; it shall, however, be in the power of the Council to vary the commencement and duration of a session should it appear necessary.

31. There shall be at least one additional meeting held during the summer months, at some place of general interest to the Association.

32. Special meetings shall be convened by the president on the requisition of ten members, or may be convened by the Council.

33. When any matter relating to professional practice is under consideration at any meeting, it shall be open only to members and associates in practice.

34. Each member shall have the privilege of introducing a visitor to the ordinary meetings of the Association, except when any special business may be under discussion. Each visitor and the member introducing him to sign their names in a book provided for the purpose.

VIII.—Alteration of the Rules.

35. No alteration of the rules shall be made except at the annual general meeting, or at a special general meeting. Seven days' notice of the proposed alteration to be given in either case in the circular convening such meeting.

It is stated that the War Department have decided to proceed at once with the erection of a station hospital and accessory buildings at Shorncliffe Camp. The work will be carried out by private contract, a tender having been accepted, and it is understood the cost will amount to nearly 30,000*l*.

WEST OF SCOTLAND SANITARY ASSOCIATION.

THE annual meeting of the West of Scotland Sanitary Association was held in Glasgow, Mr. James Aitken presiding. The report showed that during the year there had been 534 houses examined, as contrasted with 447 in the previous year; 765 visits paid, against 611; and 465 reports issued, against 393. The income for the year amounted to 967*l*. 16*s*. 1*d*., and there is a balance in favour of the Association of 171*l*. 16*s*. 5*d*. The Chairman, in moving the adoption of the report, said the Association had raised the standard of sanitary matters in the city, as masons, plumbers, and others connected with sanitary matters had been instructed by it, and were now much more alive to the matters it urged than was formerly the case. Even in the case of churches it might be safely said that the imperfect ventilation was in many cases not unconnected with defective drainage.

BUILDERS' BENEVOLENT INSTITUTION.

THE election of two pensioners on the funds of this charity took place on Thursday, November 29, at the offices of the Institution, 35 Southampton Row, Bloomsbury Square. Mr. Basil P. Ellis (president) occupied the chair, and amongst other friends of the Institution there were present Mr. Geo. Plucknett, J.P. (treasurer), Mr. C. Bussell, Mr. J. T. Bolding, Mr. T. Stirling, Mr. T. Stirling, jun., Mr. T. F. Rider, Mr. C. B. Kew, Mr. R. Perkins and Mr. J. W. Scrivener. There were two vacancies for pensioners, viz. for one man and one woman, there being one male and seven female applicants.

At the close of the poll the scrutineers (Messrs. T. Stirling and T. F. Rider) announced the result, which was as follows:—Jack Taylor, Bermondsey, aged 62, master slater, 135 votes; Sarah Elizabeth Drake, Tylers and Bricklayers' Almshouses, Ball's Pond, aged 64, widow of Francis Drake, builder (seventh application), 3,273 votes; Mary Ann Healing, Curtain Road, aged 64, widow of Samuel Healing, builder (fifth application), 590 votes; Diana Elizabeth Powell, Camberwell, aged 61, widow of G. T. Powell, late a pensioner (second application), 1,976 votes; Mary Anne Bowley, Tyler's Cottages, Ball's Pond, aged 67, widow of H. R. Powell, late a pensioner (first application), 569 votes; Eliza Ellis, James Street, W., aged 75, widow of E. G. Ellis, builder (first application), 1,126 votes; and Ellen Batchelder, Carshalton, aged 61, widow of Chas. Batchelder, builder (first application),

580 votes. The successful candidates were therefore Jack Taylor and Sarah Elizabeth Drake.

Votes of thanks were passed to the Chairman and the scrutineers, and the proceedings terminated.

VESTRY OF ST. MARY, ISLINGTON.

THE underground convenience which is constructed under the carriageway of High Street comprises entrance and exit staircases enclosed by wrought-iron railings, six w.c.s, twelve urinals, lavatory with three basins, attendant's room and two store-rooms. The roof is formed of pavement lights supported on steel joists, and is laid out as a refuge. The brickwork has been built in Portland cement. The interior is faced with white glazed bricks with a plinth and dado of blue glazed bricks, the whole being laid with very fine joints. To prevent the soaking of water into the brickwork a horizontal damp course has been laid in all walls at the floor level, the back of the exterior walls has been twice coated with a boiling mixture of tar and pitch, and a backing of dry rubble has been put round the walls and drains formed of channel pipes laid so as to discharge subsoil water through weep-holes in the exterior walls into gullies inside the convenience.

The drains are formed of glazed stoneware socketed pipes jointed with cement and made watertight. They are ventilated into brick chambers in the carriageway, the chambers also acting as surface water gullies.

Doulton's "Simplicitas" w.c.s have been used, and they are flushed by the "Paisley" cisterns, each of three gallons capacity. The basins are fixed by bolts embedded in concrete, so that a basin can be replaced, without disturbing the tiling of the floor, by simply taking off the nuts and placing another basin over the bolts, which remain fixed permanently in the concrete, and replacing the nuts. Charles Smith & Sons' indicator locks have been fixed on the doors of the w.c.s.

The urinals have semicircular backs of white glazed ware, with screens and backs of Rouge Royal marble. The only special feature in the construction is a movable slab in the back, which makes the pipe, to each urinal accessible without the removal of the whole of the marble back. The lavatory is furnished with Doulton's pedestal basins of the tip-up kind. All the frames of the doors and partitions have been set on chamfered bases of York stone 3 inches above the level of the floor, in order to prevent their lower parts being injured by water

splashed from the hose. The floors are laid with vitreous tiles. Cast-iron gratings and a central lamp column, on the refuge have been provided for the ventilation of the convenience. Gas-jets fixed over the doors of the w.c.s will light the convenience at night, and the products of combustion will be collected by hoods placed above the jets, and conveyed by tubes discharging under the ventilating gratings on the refuge.

The work throughout has been designed by Mr. J. Patten Barber, M.Inst.C.E., chief surveyor to the Vestry, and carried out by Messrs. Doulton & Co., sanitary engineers, London, Paisley and Paris, the cost amounting to 1,510*l*.

THE SMOKE NUISANCE IN GLASGOW.

AT the Glasgow Central Police Court, on November 28, the principals of a printing firm in Union Street were charged with permitting a smoke nuisance at their works. No prosecution has been instituted heretofore in cases where the smoke has been emitted for less than ten minutes in one hour, but the authorities have decided to prosecute even though the emission be under that limit.

After evidence had been given, Mr. Gray, C.E., and Mr. G. Carruthers Thomson, C.E., submitted the following report on black smoke and its prevention, which they had prepared on the instruction of the authorities:—

Insufficient Boiler Power.—When this occurs the fireman has to force the fire unduly in order to obtain the largest amount of work out of the boiler, and he does so at the cost of the fuel and a large emission of black smoke. The sole remedy in this case is more boiler power.

Unskilful Firing.—In this case the fuel is generally thrown into the furnace in large quantities until it is practically filled with coal, the temperature of the furnace being lowered by such a mass of cold fuel, and the air admission through the fuel being unduly restricted black smoke in volumes is the result. The boiler power in this case may be ample, and all that requires to be done is to regulate firing so that only small quantities of fuel be thrown on the furnace at one time, so as to keep the temperature high. The adoption of the system of alternate side firing in such a case will do away with the emission of black smoke, and only a few minutes of light smoke will be observed.

Quality of Fuel.—Where the fuel is very poor and dirty, or the other extreme, rich and gassy, smoke may be emitted to a considerable extent if the fireman does not pay attention to

ART PLATES FROM "THE ARCHITECT."

Awarded Gold Medals, International Health Exhibition and Architectural and Building Trades Exhibition (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing.

THE MARTYRDOM OF ST. STEPHEN. By E. J. POYNTER, R.A. Size, Forty Inches by Fifteen Inches. Price One Shilling. Free by post, carefully packed inside patent roller, One Shilling and Three Pence.

"AND THE SEA GAVE UP THE DEAD." By Sir FREDERIC LEIGHTON, President of the Royal Academy. A few Proofs of this Fine Art Plate can be obtained (if ordered at once), price Two Shillings each. Free by post, carefully packed inside patent roller, Two Shillings and Two Pence.

THE BANQUET. The well-known and beautiful Chromo-Lithograph by H. STACY MARKS, R.A. Size, Thirty-nine Inches by Fifteen Inches. Price One Shilling. Free by post, carefully packed inside patent roller, One Shilling and Three Pence.

1. AN OFFERING TO CERES. 2. THE EDUCATION OF BACCHUS. 3. MINERVA VISITING THE MUSES. 4. JUDGMENT OF MIDAS. By W. HAMILTON. Size of each plate, Forty Inches by Fifteen Inches. The whole forming a very beautiful Frieze in Bartolozzi Mezzotint. Price per set, Six Shillings on Proof Plate. Free by post, carefully packed inside patent roller, Six Shillings and Six Pence.

THE HISTORY OF JOAN OF ARC. By M. JULES EUGENE LENEVEU. From the Wall Painting in the Panthéon, Paris. Four Pictures on one Plate. 1. Domremi: Inspiration. 2. Orleans: Struggle. 3. Reims: Triumph. 4. Rouen: Martyrdom. Size Forty Inches by Fifteen Inches, on Proof Plate. Price, Two Shillings. Free by post, carefully packed inside patent roller, Two Shillings and Six Pence.

THE WATERLOO HEROES. By J. P. KNIGHT, R.A. Dedicated, by Special Permission, to VISCOUNT WOLSELEY, K.P., G.C.B. Proofs, price One Shilling each (thin Plate Paper). Proofs (Special), price Two Shillings and Six Pence each (thick Plate Paper). Size, Twenty Inches by Thirty-six Inches. Framed and Glazed in Oak, Complete, One Inch, Twelve Shillings each. Ditto, One and a Quarter Inch, Fourteen Shillings each. Ditto, One and a Half Inch, Seventeen Shillings each.

THE TOILERS OF THE DEEP. Two Tinted Ink Photographs. Size, Eighteen and a Half Inches by Thirteen and a Half Inches. Price Two Shillings. Free by post, carefully packed inside patent roller, Two Shillings and Three Pence.

JOHN SELL COTMAN'S PICTURES, lately on Exhibition at the Burlington Fine Arts Club. The Plates are uniform in size. Twenty-one Inches by Fifteen Inches. The Titles are as follows:—1. Rouen from Mount St. Catherine. 2. Breaking the Clod. 3. View in North Wales. 4. Norman Arches. 5. Byland Abbey. 6. Norwich, from the Cromer Road. 7. Dewy Eve. 8. Mousehold Heath. 9. Cader Idris. 10. Castle Eden Dean, Durham. 11. Bamborough Castle. 12. The Interior of Norwich Cathedral. 13. Mountain Pass in the Tyrol. 14. Postwick Grove.

The price of the Set is Twelve Shillings and Six Pence; by post, carefully packed in patent roller, Thirteen Shillings. Kindly order early, as only a limited number of proof copies can be obtained.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the
Publisher, P. A. GILBERT WOOD, 175 Strand, London, W.C.

his method of firing. This can only be remedied by the attention of a skilled and intelligent fireman.

Defective Flues or Building-in of Boilers.—This defect usually shows itself by affecting the draught of the air supply to the furnaces, and the only remedy is to put the flues in order and rebuild the setting of the boiler.

Defective Draught.—This is sometimes caused by the chimney being too small in height and diameter, and this can only be remedied by rebuilding the chimney, or by using some mechanical method of increasing the draught. Some fuels require more draught to insure thorough combustion than others, and where the draught cannot be altered the fireman must use his intelligence and fire the furnace to meet the existing conditions. With reference to the use of mechanical stokers and smoke-preventing appliances, the mere fact of their being in use on the boiler will not prevent the emission of black smoke, and here, as in using the shovel in hand-firing, the intelligent and skilful fireman can do away with black smoke and take the most out of the fuel, but if he has to take all the work out of the boiler that is possible he cannot avoid the emission of black smoke. In order to prevent smoke it is necessary to fire lightly and often, and to attend to the regulation of the draught by means of the damper. The difference on the amount of fuel used in the same boiler under the same conditions by a good stoker and a bad one runs from 10 per cent. to 25 per cent., an amount which more than makes up for the difference in wages. As the result of actual experience, the emission of black smoke for ten minutes per hour from a chimney is unnecessary, as a battery of several boilers can be fired and steam kept up with, at the outset, two minutes of black smoke, three to five minutes medium and about fifteen minutes very light smoke per hour, so that no excuse should be taken where this is exceeded. In plate furnaces smoke can be avoided quite well if properly fired, and the same applies to steel reheating furnaces where gas is used, in the management of the gas and air supply, and the dampers are regulated to suit the work. A little black smoke is unavoidable when lighting up fires and when everything is cold, or breaking up fires after they have been banked up for some considerable time, but beyond this the emission of black smoke is unnecessary where the boilers are of sufficient power and, as previously stated, where every attention is paid to the other different points.

In answer to Mr. Neilson, both engineers said that the ten minutes standard was not in accordance with modern appliances, and they were of opinion that in numerous cases prosecu-

tions should be instituted when there was less than ten minutes of black smoke in the hour. As this was the first case of the kind a penalty was not inflicted.

FIRE PROTECTION.*

I SHOULD first explain what I understand fire protection to be. The term is, I am afraid, all too often misunderstood. Fire extinguishing, in other words fire-brigade work, is what the majority have in their mind, and how many towns do not consider themselves well protected if they can boast of an efficiently manned fire-engine establishment. In reality the fire brigade as such has but a minor rôle in a rational system of protection. Really well-protected towns owe their position in the first place to properly applied preventive legislation based on the practical experience and research of architects, engineers and fire experts.

Fire protection as I understand it is a combination of fire protection, fire combating and fire research. Under the heading fire prevention I class all preventive measures including the training of the public, and under the heading fire combating I class both self-help and outside help.

Preventative measures may be partly contained in the Local Building Act and partly in a separate code of fire-survey regulations, if necessary supplemented by special rules as to the treatment of extraordinary risks such as the storage of petroleum, the manufacture of explosives and the performance of plays. The training of the public I speak of may be simply such as can be quite informally commenced at school and then continued by official or semi-official warnings, and a judicious arrangement with the ever-powerful Press as to the tendency of their fire reports.

I am not speaking in the abstract, as such forms of training have already been successfully introduced. I know of towns where the authorities have, for instance, had some of the meaningless fables of the Board School "Standard Reader" replaced by more instructive ones, which warn children not to play with matches, and teach them to run for help in case of an emergency. There are quite a number of municipalities where regular warnings are issued, to take an instance again, every December, as to the dangerous Christmas-tree. In such places every inhabitant has at least an opportunity of learning how to throw a bucket of water properly, and the nearest way

to trip up a burning woman and roll her up without fanning the flames. The householder is officially informed where the nearest fire-call point is, and how long he must expect to wait till the first engine can reach his house. If he is a newspaper reader he will also have ample opportunity of knowing the resources of his town, and the local reporter's fire report will give him much useful information based on facts or hints supplied by the authorities.

I said I classed both self-help and outside help under my heading "fire combating."

The self-help I speak of mainly affects the protection of large risks such as factories, stores, public places of amusement, where it lends itself to regulation. The requirements of the fire-survey code may allow for the arrangement of hydrants in certain risks, and also for their regular inspection, and the means for self-help may be thus given. These means will, however, probably not be properly made use of unless some of the employes engaged on the risk are posted in their purpose, and have confidence in everything at their disposal. The possibility of proper self-help in dangerous risks may be encouraged by enforcing regular drills for the employes, and regular inspection as to their efficiency. There are towns where great reliance is placed on the efforts of such amateur firemen. In some cities they even receive extra pay, and are formed into units, properly uniformed and equipped, and retained by the fire brigade as a reserve force for great emergencies.

Self-help for the shopkeeper, the lodger, or the private householder can scarcely be regulated. The opportunities I mentioned a few minutes ago under the heading of public training would already assure an intelligent behaviour on the part of a large percentage of the community. I know places where, without any regulation being attempted, and thanks entirely to the influence referred to, most residences can boast of a hand-pump, a bucket, and a crowbar, the proper use of which is known to most of the household. Self-help in small risks may, however, be distinctly encouraged by the authorities, without any irksome interference with personal liberty, simply by the provision of street pillar-boxes, with the necessities of first aid, including perhaps a couple of scaling-ladders, and further, the arrangement of some opportunities for householders to learn how to handle them. Put a street-pillar of this kind in a fire-station, reserve certain afternoons in the year on which this elementary instruction will be given, and the students afterwards shown the fire-station or treated to a "turn out,"

and there will be quite a number availing themselves of the occasion. No matter if curiosity, real interest or wet days bring them there, the object in view is obtained.

When I speak of outside help I, of course, in the first place, mean organised outside help, and not simply such aid as is tendered by the casual passer or the neighbour. The link between self-help and outside help is the fire-call.

The efficiency of the fire-call depends not only on the instrument employed and its position, but also on its conspicuousness and the indications given to find its whereabouts. These indications are quite as important as the instruments themselves. The conspicuousness of the instrument alone does not suffice. Of the official notifications given in the Press, those of the position of the call points are among the most important. An indication at every street corner as to the direction to take to reach the point, or perhaps better, as I also know it, the conspicuous advertisement of the nearest call point over every post pillar-box and inside every front door, may enable even the veriest stranger to call assistance and minimise the chances of seconds being lost in search of the instrument. I will not now refer to the instrument itself. It is immaterial for the moment if the helpers are called by a bell outside a fire-station, by a messenger from some special messenger service, or if the call come through a telephone or an electric automat. Any instrument will do that insures the call being transmitted with a maximum speed and certainty, and in full accord with the customs of the country.

As to the organised outside help, it may not simply be limited to the attendance of the fire brigade. Special arrangements may be made for the attendance of the local police force, a public or private salvage corps, an ambulance, or in cases a military guard. Then I know of instances where arrangements are made for the attendance of the water and gas companies' servants, even officials from the public works office, insurance surveyors, and the Press. I know places where the salvage corps arrives on the scene almost simultaneously with the fire brigade. I know others where the police generally are on the spot in good force five minutes after the first engines. I know two cities where the ambulance waggon and the steamers arrive together. Another where the military authorities always send a fire piquet, which is turned out in ten minutes.

If all these auxiliaries come together, and no matter how high the rank of the individual commanders, the senior officer of the fire brigade, even should he exceptionally only hold non-commissioned officer's rank, must, however, have the reins, and

Length. Fourteen Feet Seven Inches by Fifteen Inches deep.

A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, BY
M. PAUL ALBERT BAUDOIN.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 STRAND, W.C.

May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates.

his authority must be fully recognised. There are, unfortunately, not many places where this is the case, but I would lay stress on it that the efficiency of the outside help depends in the first instance on the clear definition of duties and powers of all concerned, the legal foundation, in fact; then on the organisation, the theoretically as well as practically correct executive; and, last, but by no means least, the prestige, the social standing, the education of commanders and their ability to handle men easily. For the rank and file of the fire brigade, clearheadedness, pluck, smartness, agility, will be as invaluable as it is dangerous to have reckless dare-devilry in the force, showy acrobaticism or the insane ambition for distinction.

Under the heading "fire research" I include all theoretical and experimental investigation as to materials and construction combined with the chronicling of practical experience in fires, then the careful investigation and chronicling of the causes of fires, assisted where necessary by a power of fire inquest for interesting, suspicious or fatal cases. I also include experimental investigation as to natural and accidental causes as distinct from criminal causes. Research for criminal cases may not only be assisted by a fire inquest as we understand it, but also by immediate formal inquiries held on the spot by the senior fire brigade and police officers present, or by immediate Government investigations held on the same lines as inquiries into explosions. As to the general research work, I would mention that there are several cities where, of late years, a number of experts have been regularly employed superintending a series of experiments on the resistance of iron, steel, wood and stone. Some towns have special commissions of experts who visit all big fires within a day's travelling, take photographs and sketches, and issue reports as to how the materials were affected. Then there are the usual statistics as to the outbreaks, their recurrence and causes, and in some places such tables are supplemented by reports on experiments on oil lamps, their burners and wicks, electric wiring, and the like.

I said fire protection to my mind consisted of fire prevention, fire combating and fire research, and I have tried to explain to the best of my ability what these headings cover. Before entering into detail, I should now wish to touch on the financial aspects of such protection and mainly its relation to the public purse.

Fire Protection and Fire Losses

We all know that property destroyed by fire is practically an absolute loss. This loss may only actually affect the owner, or it may be distributed among a number of people who are taxed for it in form of a contribution to their national or local fire fund, a share in some mutual insurance ring, or in the more usual insurance companies' premium. In the first two cases there are also some expenses to subscribe to in connection with the management of the fund or ring. In the latter case not only the expenses of management have to be covered, but also the costs incurred in running the insurance enterprise as such, and then a further amount for division amongst those who share the risk of the venture, in other words, the insurance company's shareholders.

We must here distinctly discern what is a loss and what is an expense. The sinking fund of the large property owner should cover a loss with a minimum extra expense; insurance in an extravagantly managed company paying large dividends will cover a loss, but with an unnecessarily large extra expense. In every case the loss remains, and as property may always be considered part of a commonwealth, the community, province, or nation, as the case may be, suffers. It is always in the interest of a nation to minimise its natural losses, no matter whether they fall on one individual's shoulders or on many, if such losses are good for certain trades or not.

With a suitable system of fire protection it is possible to bring these losses to a minimum, but this minimum would probably only be reached by an extra expense, which would fall heavier on the insurers' pockets in the form of municipal rates than the higher premium for the greater risk. A practical minimum is all that can be attempted, and that practical minimum varies according to circumstances. Most property owners would, I believe, grumble if a greater immunity from fire were to cost them much more than the danger. They would prefer a greater loss to an extra annual payment out of pocket.

Practical protection must mean smaller annual insurance dues, and the actual extra cost of this protection should be something less than the saving off these dues. Then the nation not only has a smaller dead loss, but the owner also has a smaller annual expenditure for his combined contribution towards the losses, the management of his insurance and the

protective measures. Where there is mutual insurance or municipal insurance in its best sense, the losses by fire and the costs of the protection are often booked in one account, and the better protection up to a certain point should mean a smaller individual annual share. Where there is company insurance the municipal rates increase to cover the cost of extra protection, but the insurance premiums are expected to proportionately decrease. Competition and public opinion generally force this decrease of the insurance rates as soon as there is a greater immunity from fire, and where they do not, the appearance of that wonderful phantom called "municipal insurance" generally brings about the desired reduction. Where the insurance companies are well managed, and the shareholders are satisfied with reasonable dividends, protection can be said to find favour with all concerned, but if the protection is arranged for, and the companies do not do their duty, the result for the property owner is by no means a pleasant one. I unfortunately know several cases where property was greatly improved from the fireman's point of view, and the ratepayers supplied regular surveyors, and even a fire-watch, and yet the insurance company interested would not reduce its charge. Of course such tactics do not encourage good protection.

I may as well at once here touch on the question of insurance companies subscribing towards the maintenance of a fire brigade. The argument municipalities use is to the effect that the insurance companies derive all the profit from a good fire service, and should contribute towards its cost. Now, as just said, where properly managed companies have the business, a better fire service means a smaller premium to the ratepayer. If the ratepayer has to pay for extra protection in form of an increased municipal rate, or in form of an increased premium, raised to meet the contribution levied, surely it is simply juggling with figures. Of course I full well know that the contribution in the latter form helps to popularise the municipal budget, but surely this is not of any real account. Now this is all quite independent of any argument in favour of fire protection being considered in the same light as police or sanitary protection, which are everywhere held to be ratepayers' affairs in the fullest sense of the expression. We do not hear of municipalities in want of a popular budget asking burglary and life insurance companies respectively to contribute to the expenses of their police force or sanitary department.

To refer to the advantages and disadvantages of municipal insurance in connection with this study would be out of place,

and I scarcely hold the question to have any considerable bearing on the subject. At the most, to my mind such municipal insurance could only further the actual protection by the opportunity it would give the authorities to fully realise the extent of the losses and the effect of their efforts. Any saving accruing for the ratepayers owing to shareholders' dividends and other extra costs not having to be covered in the insurance premium should not affect actual protection. Of course, the municipal insurance premiums may be so figured as to leave the authorities a revenue which is devoted to protective measures. This again is, however, generally only done to reduce municipal rates and juggle with figures. The protection actually required remains the same, and the ratepayer will have to pay for it, no matter in what form.

I am no friend of municipal insurance if planned with the idea of obtaining a revenue from it, and I do not even hold a general fire insurance business to lend itself to official management. I, however, know a number of cities where the authorities limited themselves to taking house risks only, and most satisfactory results were thus obtained. In these cases the chief ambition was simply to insure a maximum distribution of losses, a rapid re-erection of buildings gutted, and an economising of insurance expenses. Mortgage transactions on house property were facilitated and a reduction of the criminal cases obtained.

The Cost of Fire Protection.

As to the actual extra cost of a practical system of fire protection above that of the more usual merely combative establishment, I can only say that where changes for the better were made, it was really astounding how cheaply the greater immunity from fire was obtained. In the first place, I would point out that the special fire clauses embodied in a Building Act would of course be attended to by the same executive authorities as would in any case superintend the general structural matters, and that the additional work would at the most require some increased clerical aid. If the execution of the fire survey regulations were delegated to the same authority, there would again simply be some extra clerical aid to pay for, and the salaries of perhaps a few extra surveyors. To make the inspections thoroughly efficient, it may be found advisable in instances to form parties of three for the rounds. The second man would, in this case, be a fire brigade officer, and the third probably a master chimney sweep, who would have to receive a special retaining fee.

The cost of the public training I referred to would be

minimal, as the elementary part would simply be included in the schoolmaster's work, and the press matters could be easily managed in the fire brigade office. Payments would only have to be made for advertisements, such as the official warnings, lists for fire-call points, &c., and perhaps for the publication of semi-official hints. Self-help, as far as inspection and drills for amateurs spoken of are concerned, would be in the hands of the fire brigade. There would, however, be an extra expense for the purchase and maintenance of the street appliances I referred to.

The most expensive items in the system of fire protection undoubtedly come under the headings—fire call and fire brigade. As to the former, however, I would mention that there are quite a number of cities where the cost is modified by having the whole of the electrical service for police, ambulance and fire brigade, and even public clocks, managed by a separate municipal department. The same wires will call up each of these services, and as the same staff attend to their maintenance, the fire protection of a city need only be booked with perhaps a third of the outlay it would occasion if managed independently. The combined system has also the great advantage of facilitating the mutual working of the different services in case of an emergency. The call-point indicators which I have referred to, of course, also cost money, but here again, if the three services work together, the expenses on the count of fire protection can be lessened. Speaking of money rewards given in some cities to the individuals who first call the fire-engines, I would point out that such gratuities can become a heavy item, and I have some doubts if they in reality do much good.

As to the outlay on fire brigade establishment, I would here only say that I am a friend of systems which allow for a strong active force supported by efficient reserves. The latter should be as inexpensive as possible, but by all means at least a part paid and disciplined body which could be easily called in for emergencies. Fire brigade budgets cannot allow for an active force being ready for such curious coincidences as an unusual number of large fires starting simultaneously, but they must allow for an ample strength always being forthcoming for the ordinary emergencies, and this with all due consideration of the men's rest and possible sickness. An undermanned fire brigade is an anomaly which is generally fatal not only for the property owner, but also for the whole efficiency and *esprit* of the force. The budget must also allow for an attractive pay, for the profession is one which requires men who have a

maximum of the sterling qualities we look for among the pick of a nation. It must also not be forgotten that the fire service is one of the few where a system of pensions is the only fair way of recognising the risks of limb and health, and at the same time influencing that stability of a force in which the practical experience of long service is so essential. The budget must also not forget that an ample reserve of appliances is a necessity.

Whether the force should be so strong as to permit its having a separate section for salvage corps purposes depends on the circumstances. I at all events hold that, if a salvage corps is required, it should be part and parcel of the municipal brigade, organised on the same lines with a reserve, and this no matter again if the insurance of the locality be managed by the authorities or by the companies. If the corps is necessary, it matters again little if it be paid for out of premiums or rates. To my mind there would, however, not be very many towns where a special salvage section would find sufficient work, taking it for granted general protective measures are good, and that the tactics of the firemen are such as will give no occasion to fear an unnecessary water damage. Of further expenses which have to be considered there are items for fire research and fire inquest. If managed economically, due confidence being placed in the opinions of the fire officers and surveyors, there is no reason why the outlay should be great. The statistical work would only require some clerical aid. Where special coroners are retained for criminal cases some extra money will of course be required, but even here the costs need not be excessive, as there are many retired fire brigade officers and fire surveyors who are most suited for the work and would well be satisfied with a small emolument.

The last items I wish to enumerate are those for the water supply. There are but few places where special fire high-pressure mains are laid on in the interests of fire protection. As a rule the costs which are debited to the heading "Fire Protection" have simply to cover the maintenance of hydrants and tablets, or at the most the cost of the water actually used for fire-extinguishing purposes. Sometimes the cost of hydrants is shared with the scavenging department or the Commission of Sewers, who also have the use of them. Where the provision of water and hydrants falls to a private water company the property owners will, of course, be paying their share for them indirectly in the form of water rates.

Now you will have noticed that all the expenses referred to are such as to my mind fall on the public purse, and that I

have not taken into account the actual cost of the better construction or arrangements which the Building Act and fire survey regulations would require. The property owner would have to cover this expense individually, but I shall not call it a special or extra outlay, as I consider stability, with due attention to sanitation and fire protection, should be the essence of modern building construction. Surely inferior construction not only shortens the life of a building, but it is also in every way detrimental to the interests of a *bona fide* investor. Safe construction enhances the value of a property, and the protective measures need not occasion much additional expense. Why not consider fire protection just as much a primary necessity for building as the block signal system is for railway construction. Is there much difference in abetting a man's death by fire and his death in a railway accident? Why consider it more legitimate to spoil your neighbour's property by fire than to steal it? Bad construction means a risk to one's neighbour's life and property as well as to one's own. It may not only cause a direct loss, but also spoil the man's business for years, and throw those out of employment who are dependent upon him. Why permit injuries of this kind?

Now, this is the first time I have in any way distinguished between the safety of life and the safety of property. The protection of property to which I may have seemed to be specially referring this evening must in any case include measures for the protection of life, as no fire can originate without there being some personal danger. It is practically immaterial if this danger affects the inmates or the firemen. The protective measures will stand good for both. Means for life-saving must be forthcoming as soon as possible after an outbreak had been signalled, as the helpers themselves may want them quite as much as those in or near the building attacked. It should also be remembered that both a good staircase and a ladder are often quite as useful for the manœuvring of the firemen as for life-saving purposes, and that they are practically quite as essential for the saving of property as for saving life. I do not hold that any distinction need be made between the two risks when speaking of fire protection in general, but as the safety of a single human life is apparently classed higher than that of the most valuable property, it may be well to give life saving the first place when alluding to the two separately.

Up to the present you will have noticed I practically only referred to the prevention of fires originating from natural

causes, negligence, or accident. Criminal fire raising may seem not to have had sufficient attention. Well, to my mind there is little or no criminal work where a perfect system of fire protection has been introduced. What with good construction and a fire survey, the quick arrival of the firemen, and careful inquests, the risks of detection are far too great.

(To be continued.)

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

22297. Andrew Barr, for "Improvements connected with windows."
 22308. Charles Gordon Picking, for "Improvements in bricks or blocks to be employed in the construction of the floors of fireproof and other buildings."
 22315. John Cæsar Craine, for "Improvements in window-sash fasteners."
 22350. Robert Lofthouse, for "Improvements in ventilators."
 22368. Gustav Czerwonkey, for "An improved roofing tile."
 22385. Thomas Curtis and William Charles Middleton Curtis, for "Improved Dublin pattern, valveless, silent, syphon flushing cistern for water-closets, latrines and the like."
 22418. Ada Mary Coleman, for "An automatic shut-off connector for taps, water and other pipes."
 22421. Albert Joseph Stannah, for "Self-opening doors."
 22495. Sidney Barwise, for "Improvements in lead pipes or tubes for conveying water or other liquids."
 22509. Edwin Thomas Howard, for "Improvements in flushing tanks and the like."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. KAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

JOHN GRUNDY,

Heating Apparatus Manufacturer.

ESTIMATES FREE.

SUCCESS GUARANTEED.

FOUNDRY:—TYLDESLEY, MANCHESTER.

Showrooms and Workrooms:—TYLDESLEY BUILDINGS, TORRENS STREET, ISLINGTON, N.

West End Showrooms:—57 WIGMORE STREET, LONDON, W.

Chief Office:—30 DUNCAN TERRACE, CITY ROAD, LONDON, N.

WINTER, WARMTH AND COMFORT.

HEATING AND VENTILATING APPARATUS. GRUNDY'S SPECIALTY. PURE WARM AIR.

UPWARDS OF ONE THOUSAND TESTIMONIALS RECEIVED.

PURE WARM AIR AS SUPPLIED TO

Truro Cathedral; Londonderry Cathedral; Sherborne Abbey; Kilmore Cathedral; Stanley Cathedral, Falkland Islands
 Cardiff Catholic Cathedral; the Queen's School Chapel, Eton; Cork Asylum; Leicester Asylum; and to upwards of
 three thousand Places of Worship; and a great number of Mansions, Houses, Hotels, Hospitals, Schools, Warehouses
 Factories, Workhouses; Cork Law Courts, &c., &c.

84 Brook Street, Grosvenor Square, W.: December 8, 1893.

Sir WILLIAM BROADBENT encloses cheque for the "GRUNDY" HEATING APPARATUS supplied to his house, and is glad to say that it has proved very satisfactory for warming and ventilating as required. The principle of the apparatus is most excellent.
 To Mr. Grundy.

PROFESSOR TYNDALL writes:—

Dear Sir,—My house being so well provided with grates and flues for the generation and distribution of pure warm air, I have been thus enabled to spend my winters in England instead of on a foreign shore.—Yours very truly,
 JOHN TYNDALL.

Dear Sir,—I have much pleasure in informing you that we have found your HEATING APPARATUS a great success in our new Epidemic Hospital, which consists of a two-story building, each story containing two large wards, a smaller isolation ward, and two nurses' rooms. It is easily managed, does not cost much for fuel, and the air entering is most pleasant, warm, and free from smell. It is with the full concurrence of the Managing Committee I give you this testimonial. Yours faithfully, JOHN MARSHALL DAY, Registrar and Resident Medical Officer.

THE
Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TRADE NOTES.

At St. Peter's Church, Eaton Square, a low chancel wall of Pavonazza marble, panelled in various coloured marbles, has just been completed by Messrs. Earp & Hobbs, of Lambeth and Manchester, preparatory to the erection thereon of an elaborately wrought metal screen, now in the hands of Messrs. Hart, Son, Peard & Co., of Drury Lane, W.C., and Birmingham. The work is from designs by Sir Arthur Blomfield & Sons.

THE Portishead Local Board has received the Local Government Board's sanction to borrow 14,000*l.* to carry out the works in connection with the proposed sewerage scheme, 12,000*l.* to be repaid within thirty years and 2,000*l.* within fifteen years. The works include eight miles of sewers of various sizes, a sea outfall, 136 manholes at an average depth of 11 feet 6 inches, about 100 iron ventilating shafts, air-compressing station with gas-engine, air-compressors, cottage for attendant, ejectors, air-mains, &c. Estimates will shortly be invited for the carrying out of the works, as it is proposed to commence operations without delay. Mr. T. J. Moss Flower, Assoc.M.Inst.C.E., Carlton Chambers, Bristol, is the engineer.

A PUBLIC inquiry is to be held on December 21, at Portishead, by one of the inspectors of the Local Government Board, the Portishead Local Board having asked permission to borrow 1,100*l.* to carry out private street works.

NEW schools are being erected for the Maesteg School Board from the plans and under the direction of Mr. E. W. Burnett, architect, Tondy, Bridgend, and will be warmed and ventilated throughout by means of Shorland's patent Manchester grates.

A NEW turret clock, showing time on four illuminated dials, has been placed in the tower of the Southport Infirmary by Messrs. Wm. Potts & Sons, of Leeds and Newcastle, the donor being Councillor W. Austerfield, J.P.

IN our issue of to-day we publish a letter from Messrs. Manlove, Alliott & Co., Limited, and in our next issue we propose to refer to Dr. Sergeant's patent, "The Incinerator."

THE patent Venetian window-blind, by the "Lux" Patent Venetian Blind Company, Limited, of Birmingham, deserves to be called the lightest, most perfect and cheapest Venetian blind. This blind is the result of many years' investigation and practical tests, and is produced by machinery specially

designed, constructed and patented by D. Clarke, the inventor and patentee of the metallic Venetian blind, who is the engineer and managing director of this company. The laths of the "Lux" patent Venetian window blind are manufactured from a papraceous lignine, which is hard, tough and exceedingly light. They are corrugated in the direction of their length, which imparts to them great strength and at the same time secures a soft and subdued light in the apartment, which is pleasant and restful to the eye and the mind. The following are some advantages claimed for these blinds:—They are considerably cheaper than ordinary wood or metal blinds; they are less than half the weight of other venetians, consequently the strain upon the cords is lessened and the wear and tear is considerably reduced; being so much lighter, the carriage and freight are less in proportion; they are tougher and more elastic than wood, and the laths do not get out of shape as in metal blinds; they are finished in flatted colours, consequently there is no glare from the rays of the sun; the colour of the laths is the same right through their entire thickness, so they will not blister in the heat of the sun; they are non-conductors of heat, consequently the apartments in which these blinds are used will be cooler and more pleasant in summer and warmer in winter than they would be if the old-fashioned blinds were used; they impart a delightful and subdued light to the room, which is pleasant and restful to the eye and the mind; they do not occupy more than half the usual space when drawn up; new laths can be forwarded to replace the old wooden or metal laths cheaper than the old blinds can be repainted; being made by machinery, they are regular in their formation, and can be supplied in two-thirds less time than ordinary venetians; they are produced in one quality only, no second or inferior quality is manufactured, as in the case of wooden blinds.

We have received from the Sun Insurance Office, Threadneedle Street, E.C., their issue of Christmas novelties, in the shape of calendars for desk, wall and pocket; blotter, &c. We cannot do more than commend the company for the good taste which characterises these novelties.

NEW underground conveniences, carried out from the designs of Mr. J. Patten Barber, chief surveyor to the Vestry of St. Mary, Islington, have just been completed, the difficulties of designing them, owing to restrictions of space imposing limitations of area, having been well overcome by Mr. Barber. Separate entrance and exit staircases could not be provided,

but as cockneys generally go in by the exit and come out by the entrance staircase, it is a distinct advantage not to provide the double staircase. The work has been excellently carried out by Mr. George Jennings, from the instructions of Mr. Barber.

VARIETIES.

THE Sanitary Institute held an examination for inspectors of nuisances on Friday and Saturday, the 7th and 8th inst., when 112 candidates presented themselves.

AT the meeting of the Institution of Civil Engineers on the 4th inst, Sir Robert Rawlinson, K.C.B., president, in the chair, eight members, 130 associate members and four associates were balloted for and duly elected. It was announced that 102 candidates had been admitted by the Council as students of the Institution.

AT a public meeting held in the Town Hall, Wokingham, it was unanimously resolved that there should be a memorial erected in memory of the late Mr. John Walter, of Bearwood, and a committee was appointed to report on the form that should be adopted.

THE Edinburgh and District Water Trust have approved of a Bill which they propose to promote next session, bringing in an additional water supply from the Talla at a cost of 631,000*l*.

THE works of Messrs. T. Parker, Limited, which have been erected in Wednesfield Road, Wolverhampton, have been opened. The buildings and machinery are of up-to-date character, and the establishment will give employment to a large number of workpeople in manufacturing appliances for producing what has been designated the light of the future. The structure consists of erecting, fitting, pattern and machine shops and a foundry; and while the erecting shop has a length of 150 feet, the foundry has a length of 120 feet and a width of 40 feet.

THE SURVEYORS' INSTITUTION.

AT the meeting of the Surveyors' Institution on Monday evening, Mr. William Sturge, past president, read an elaborate paper, full of statistics, on the burdens on real property and land. There was a large attendance, and the lecturer's con-

clusions seemed to meet with general assent. Mr. Sturge reviewed the question of the burdens on land, or rather, in its more extended sense, the burden of taxation on real property as distinguished from personalty. The inquiry, he said, was of special importance at the present time, when the Legislature had taken a new departure, and laid upon real property a very serious additional burden, in the face of severe and increasing depression on that large proportion of real estate which consisted of agricultural land. It might be roughly estimated that agricultural land was now paying tenfold more than it would pay if urban property and personalty paid their full share. The owner of a large estate had duties to perform and charitable calls to meet, which he could not ignore, but which the plutocrat might, if he pleased, entirely escape. The removal of the exemption of real property from the death duties, without a fair adjustment of the local rates between real and personal estate, had inflicted a flagrant injustice on the owners of real property. The effect could not fail to be felt throughout the entire community. In too many cases the manor-house would be closed; the labourers would swell the numbers of the unemployed in the great cities, the tenantry would find less money laid out in repairs and improvements, the tradesmen in the market town would complain of dull trade and reduced profits—in fact, the very classes in whose favour the new system of taxation had been adjusted would indirectly feel its effects as well as those on whom they would more directly fall. Sir Richard Paget, Mr. E. P. Squarey and Mr. F. K. Munton took part in the discussion.

PANIC PREVENTION.

In reference to the lamentable mischance which occurred in Belfast on occasion of a children's entertainment in a school-room, in which, we regret to say, four children lost their lives through panic owing to a stampede, it is an opportune moment to call attention to those who have successfully catered for providing public buildings, schools, &c., with safety fittings. The lamentable disaster could not have occurred had the Tom Jones automatic panic bolts been used. These are manufactured by James Gibbons, of 9 Southampton Row, London and Wolverhampton, at such low prices for all kinds of doors that it is surprising they are not universally used in all buildings where the public congregate. These safety fittings are so uncostly that there can be no excuse

for their not being adopted, and no church, school, theatre, music-hall, or public building of resort should be without them. We could mention numerous buildings which possess them. Among a few buildings where the "Tom Jones" improved automatic panic fittings have been supplied and fixed are the following, these fittings also having gained the approbation of the County Council:—Covent Garden Opera House, Drury Lane Theatre, People's Palace, Avenue, Grand, Sadler's Wells, Queen's, Marylebone, Holborn Restaurant, King's Hall, Eden, Niagara in London, Kilburn Town Hall, Balham Town Hall, Battersea Town Hall, Plough Music Hall, Seabright Music Hall, Lewisham Baths, Wolverhampton Theatre, Burnley Theatre, Clapham Assembly Rooms, &c.

WEMBLEY PARK TOWER.

AN extraordinary general meeting of the Tower Company (Limited), who are the ground landlords of Wembley Park, was held last week at the Charing Cross Hotel for the purpose of considering the position of the Metropolitan Tower Construction Company (Limited), and, if deemed advisable, to sanction financial assistance being granted to that company. A letter from Sir E. W. Watkin was read, expressing regret that he did not feel equal to make a journey to London to attend the meeting, but at the same time he hoped that the Tower Company would sanction the creation of sufficient capital to enable the Metropolitan Tower Construction Company to complete the Tower to its first platform, when the Tower might be opened and worked at a profit. He added his strong opinion that it would be to the benefit of the Tower Company to secure the completion of the Tower. The total capital of the Metropolitan Tower Construction Company, the Chairman added, was 100,000*l.*, which had all been issued, called up, and spent upon the Tower in Wembley Park. The Tower Company were advised that to complete the Tower to its first platform, which would be at a height of 155 feet, the sum of 35,000*l.* would be required. Owing to the ground belonging to the Tower Company, there was no security upon which the Metropolitan Tower Construction Company could raise any further money. The 2,000*l.* a year ground rent was, however, a very important matter to the Tower Company, and it was therefore to the interest of the shareholders in that company to assist in the completion of this work to at least its first platform. It was not for him to discuss

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.

WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

THE INCANDESCENT GAS LIGHT CO., LIM.,
14 Palmer Street, Westminster, London.

whether the Tower ought to have been commenced, for now that 100,000% had been spent upon it there was no alternative but to complete it to the first platform. He therefore moved a resolution altering the Articles of Association of the Tower Company so as to enable it to pledge its credit in order to secure the raising of the sum required. The resolution was carried. In reply to a question as to whether there was any prospect of completing the original designs of the Tower, the Chairman said that he believed that when the Tower had been completed and opened to its first platform, it was intended to issue a prospectus to the public, and with the money thus subscribed it was proposed to pay off the debentures and provide a working capital for the completion of the Tower. In answer to other questions, the Chairman said that the Board would consider the advisability of calling up the outstanding liability upon the Tower Company's shares, which would provide 14,000%.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

THIS Society paid a visit to the works of the East London Water Company at Lea Bridge and were kindly shown over by the chief engineer, Mr. W. B. Bryan, M.I.C.E., the various engine houses, turbine houses and other works of this ancient water company. The members inspected four Cornish pumping-engines and a new set of triple expansion overhead marine type pumping-engines, two compound horizontal pumping-engines and four Hercules turbines used for pumping. The members were also shown a rotary pump made by the Drum Engineering Company, working under a head of 200 feet, which had been tested and was stated to have yielded an efficiency of 80 per cent., many and various apparatus for facilitating communication between districts, the working and governing of the engines and pumps, amongst these being notably that of the electrically worked stop-valve, and many ingenious contrivances designed by Mr. W. B. Bryan. The members were also shown over the new boiler house, inspected the sluices, the tubular aqueduct over the canal, and had a very interesting description given to them by the engineer of the working arrangements of the company, the difficulties met with and overcome in obtaining water from their wells, and also were shown some of the original receipts of Messrs. Bolton & Watt for money paid to them at the end of last century for coal saved by those pumping-engines that had been erected by them. Among those

present were Messrs. C. T. Walrond, C.E. (the president); R. Booth, C.E.; Rowan, C.E.; Kuhne, C.E.; E. H. G. Brewster, C.E. (hon. sec.); A. Wollheim, C.E.; J. F. Reade, C.E.; W. M. Binny, C.E.

OLD SANITARY FITTINGS.

ON Monday, Mr. E. W. Hudson appeared in answer to an adjourned summons at the instance of the Vestry of St. Mary, Battersea, in respect of his premises at 29 Kersley Street, which were stated to be insanitary by reason of the soil pipe being improperly constructed and terminating too close to one of the windows. It was stated that the system of drainage had existed at the house for twelve years, and when constructed it was in accordance with the latest sanitary requirements. A similar system was in force at New Scotland Yard. Mr. Pilditch, consulting architect to the Duke of Bedford and sanitary engineer to the Marquess of Salisbury's estate, proved having made an examination of the soil pipe to which exception had been taken and failed to discover the existence of a nuisance. It was not the best form of drainage. Mr. Gower, for the defendant, argued that the vestry had no power to interfere, as they had already sanctioned the existing system of ventilation. Although medical scientific discovery had advanced, the vestry, he contended, could not compel private owners to keep property up to the standard required by each new discovery. The drain could not possibly be more dangerous now than it was before science discovered its injurious effects. It was unfair to place owners at the expense of alterations because the vestry had got hold of new sanitary notions. Mr. Young, for the vestry, pointed out that it was the duty of the sanitary authority to enforce necessary sanitary requirements in the district over which they had jurisdiction. He was unable to say that there was a nuisance, but a nuisance was likely to occur at any moment. The vestry could not defer action until an outbreak of fever occurred. Mr. Denman declined to hold that sanitary fittings were likely to produce a nuisance because they were not up to date in sanitary science. If that contention were allowed it would mean that all old fittings would have to be pulled down and replaced. It was impossible to think that the Legislature in passing the Public Health Act had any such intention. He dismissed the summons, but nevertheless thought that a temporary imperfection in the pipe should be remedied. He allowed three guineas costs.

HEWETSONS, Tottenham LONDON, W.

Court Road, HOUSE FURNISHERS & DECORATORS,

CLUBS, HOTELS, &c.—DISMANTLING, CARPET-BEATING, &c.

HEWETSONS have always at hand a staff of steady and trustworthy men to send out to take up and relay carpets and entirely dismantle.

FIRE PROTECTION.*

(Continued from last week.)

Fire Prevention.

UNDER fire prevention I first referred to the special requirements of the Building Act. The clauses can greatly influence the safety of life by requiring practical exits and sufficient staircase accommodation. I cannot here specially refer to the risks in theatres and assembly halls, which to my mind require separate legislation; I simply speak of factories, offices, business premises, hotels and tenement houses. In no case should any inmate of a building be further away from a staircase than 60 feet, and preferably there should be two staircases at his disposal in the event of one being blocked. Generally attention is only given to the construction of staircases; I would point out that their ventilation is equally important. Smoke is even a greater danger than fire, and can hamper the helpers terribly. The possibility of opening a few windows has saved many a life.

As far as the protection of property is concerned, the prevention of outbreaks can be influenced by the careful construction of flues, hearths, stoves, and, in certain classes of buildings, by the construction of floors and ceilings, the arrangement of sky-lights, shutters and lightning conductors.

Then comes the prevention of the fire spreading, first, by the division of risks, secondly, by the materials used in construction. I believe that one nation always speaks of "slow

combustion buildings," an excellent term, as the expression "fireproof" is a misnomer, and "fireproof" buildings are impossible for practical purposes. When I speak of the division of risks the legislator's first ambition must be to prevent fire in one house spreading to another, and a stranger's property, so to say, being endangered. This is quite possible, given good party walls carried well over the roof to a height regulated by the nature of the risk, the arrangement of shutters to windows where necessary, or the use of fire-resisting glass. Either a thoroughly good roof, or even better yet, a fire-resisting attic floor can do much. If the locality has a proper fire brigade and the force is decently handled, "spreads" from one house to another can be absolutely barred. In the most dangerous class of warehouse property I have seen party walls which do not only project above the roof, but in front of the façades of the building. This is perfection, though generally too expensive.

The division of a building or a large "risk" into a number of minor ones is only possible to a certain extent. I do not hold with spending enormous sums trying to make each of the minor "risks" impregnable. My ambition is simply to try to retard the spread for a certain limited time after the flames have really taken hold of the contents. In those minutes most fires will have been discovered and a sufficient number of firemen can be on the spot to localise the outbreak and prevent the conflagration being a big one. Take a drawing-room in an ordinary well-built house. If the joists are strong and the boards grooved, and if some light pugging be used and the plastering properly done, if the doors are made well-fitting and fairly strong, a very considerable amount of furniture and fittings can be well alight for half an hour before there is a spread. In a warehouse or factory "risk" the same holds good. With well-built wooden floors, thickly pugged, and the ceilings perhaps run on wire netting instead of on lathes, with ordinary double-ledged doors safely hung, at the most perhaps lined with sheet iron on asbestos cloth, a very stiff blaze can be imprisoned for an hour. The general mistake of expensive iron and concrete construction is its aptitude to allow some breach being easily made through which the fire spreads. The iron door bends and so does girder-work. Then, again, directly a fire has got a hold these composite floors are much too dangerous for firemen to work on or under. They cannot get near enough to the actual seat of the fire. Further, if a strong stream of water touches the hot iron there is often an extra danger which can only be rivalled by the effect of a falling

MAW & CO. will forward their Pattern Books, with Special Designs and Estimates for every kind of Floor and Wall Tiling, on application. Patterns can also be seen, and particulars obtained, at the Show-rooms of their appointed Agents Messrs. W. B. SIMPSON & SON, 99 St. Martin's Lane, W.C.

weight which also so easily brings about a general collapse. Then after the fire has been extinguished the ironwork will be so damaged that it will require entire renewal, and the brickwork will probably be so strained and bulged that the re-erection will have to commence from the footing. A simpler construction is in most cases the most satisfactory, and I should generally advise it as an architect. The few iron and concrete floors, for instance, which will stand some strain are to my mind too expensive to allow their introduction for fire protection alone, and when I speak of their cost, it must be remembered that it is not only the expense of the floors which have to be considered, but that also of the supports and the surrounding walls.

When speaking of the division of minor "risks," the dangerous lift wells, skylights, and shaft openings should not be forgotten; the latter should be as small as possible, well armed with shutters; the skylights should again have fire-resisting glass, and the lift not only vertical doors but also horizontal flaps, which would cut up the well into sections.

Division of "risks," common sense construction and proper staircase accommodation are really all that fire protection requires, and where the special Building Act clauses have been kept within the lines I have indicated there has been little friction and discontent. It is only when, as I have known it in a city that, for instance, a tenement house is always required to have a large passage-way, through which a fire-engine could gallop into a courtyard, that the property owner very rightfully considers himself harassed by the protective measures.

As to the fire survey regulations, they should mainly prevent the actual outbreak of fire. In certain classes of risks fire survey can also increase the personal safety of the inmates, and the possibility of a fire spreading may be lessened. The provision of fire-escapes or ladders, and a regular inspection of their efficiency, will do so much, and the examining of a rusty door-catch may save a building. The actual preventative work of the surveyor will, however, mostly consist in the warning of property owners against temporary stoves standing on ordinary floor boards, sooty chimneys, badly hung lamps, dangerous burners and gas brackets fixed in risky positions. Self-help will be greatly facilitated by the judicious arrangement of fire extinguishing gear, and a like inspection of its efficiency. Hydrants and cocks must not rust, nor must the hose get so stiff that water cannot pass through it. Hand pumps and pails must always stand ready filled. In distributing such apparatus I would point out that one of the greatest errors generally made is to forget that the amateur fireman likes to have an easy

retreat if his efforts are unsuccessful. Otherwise he may not care to use the gear at all.

I would here like to refer to the chimney cleaning. In some countries, in case of a chimney fire the owner of the property is fined for not attending to his chimneys. In others the chimney-sweeps are also made responsible if the owner can prove that he has had his chimneys regularly cleaned. Another way of treating the matter is to have official sweeps, who have the same rights as the dustmen of certain places, and can enter buildings and clean the chimneys at certain intervals after due notice. The chimney-sweeps are then alone held responsible. In the case I have in my mind, the municipal chimney-sweep department always had several men ready for attendance with the fire survey officers, and there were also some at the fire-stations ready to turn out with the firemen to a chimney fire when required.

It is, unfortunately, quite impossible to-night to touch regulations governing the "special risks" I referred to. I will only here say that as far as the safety of the public in theatres and public assembly halls is concerned, attention, to my mind, should be chiefly given to the exits. Spread of fire and even its outbreak are secondary considerations. A panic caused by a suspicion of fire can be quite as fatal as where a conflagration is actually started. As to the petroleum storage in shops, I would give most attention to preventing any direct communication between the shop or cellar and the main staircase or the living-rooms. As to the lamp question, why not prohibit the sale of dangerous lamps and burners in the same way as the sale of dangerous food?

Fire Combating.

As to self-help, I would only add that complications must always be avoided, and that the amateur fireman, above all, must be drilled on the simplest lines. I am a great friend of competition where volunteer work is concerned, and have always found annual prizes to be a good investment. One thing, however, must be instilled into the amateur mind, and that is not to waste water, a sure sign of a lack of training. Of course, the drills must be on the same lines as those of the local brigade, and on no account should other gear be used for self-help than is generally customary in that force. When volunteers and regulars' work together the latter should always remember that the paid force are experts, but the regulars must also never have that ill-bred contempt for volunteer work so often noticeable among the vulgar or mercenary. Volunteers are volunteers who

are probably experts in some other vocation outside fire-fighting, and have not had the opportunities of a professional fire fighter.

There is one point still regarding self-help which I may touch on. There are authorities who dispute the advantages of both organised and independent self-help, and who prefer the immediate call of outside help only. These authorities remember the futile help of the amateur, and perhaps the door he opened which fanned the flames before there was a sufficient supply of water ready to counteract the effect. To my mind, where there is more than one helper at hand always see that the regular fire brigade is called, and where there is one man only, never attempt self-help if the fire is well alight, but call the engines. If the fire, however, is small, and engines cannot be had within a few minutes, even if alone always try self-help. Of course so much depends on the circumstances, and also on the temperament of the first comer. Excepting one or two countries, where the natives are all too excitable, I hold that self-help, both organised and unorganised, should be encouraged.

I must now give some minutes to the invaluable link, the fire-call. There are several methods of transmitting the message. The simplest is of course to run direct to the nearest fire-station, but this is only possible where the distance is only small. In one or two cities, however, the number of fire stations is so great that they are very close to one another, and hence what I will term "direct" calls are generally recorded.

Then comes the system of special messengers. The fire is reported at some public office, police-station or guard-room, where there are always runners ready to start off to the nearest fire-station. The special runner is of course practically here simply a makeshift for the more modern telegraph or telephone line, and the only city in which I know this system to be employed is one where the unsettled political atmosphere has compelled the authorities to prohibit the construction of any telegraph line other than those for the use of the general postal service. Similar messenger services have, however, also been introduced in connection with the telegraphic signalling system. I refer to the private enterprises known as general messenger or call-boy services, which are organised for business purposes, and have the advantage of the fire-call or the police-call thrown in. In the same way as a cab can be signalled, a call may come for a fire-engine, and the ever-ready runner makes off to the fire-station, instead of to the cab rank. As a rule, these messenger offices are near the fire-station. The combination is really rather a curious one, as it embraces the most advanced notions of giving every "risk" its own fire-call, and the some-

what antediluvian one of the special runner. I have often wondered why these messenger offices have no special wires to the fire-stations.

Another system for facilitating the fire-call relies entirely on the public telephone system, the terms of subscription to which may compel holders to forward fire messages, if required to do so. This system allows for such development as the payment of retaining fees to porters in public and other buildings which have a night service, on condition that the fire-call be promptly despatched. The telephones are perhaps even provided free, if they are not forthcoming; but it should be remembered that the service always goes through the General Telephone Exchange.

Then there is the special telephone line system, where special wires are laid on to buildings which are practically open all the year round, direct to their nearest fire-stations, and some payment is again made for prompt attention. Sometimes telegraphs take the place of telephones, but this requires the porter or attendant to be specially trained to the work. To simplify matters the buildings are sometimes fitted with automatic fire-calls instead of telephones, but the principle of the system remains the same. In districts where there are few public offices the list of buildings at which messages can be handed in have been frequently augmented by a set of bakeries or chemists' shops, where night service is not unusual. What I will term semi-public street-alarms come next. Automatic fire-calls are put up in the street, but their handles are under lock and key, and the keys are only distributed among policemen, watchmen, or householders, and the messages can, hence, only be given by persons known to the authorities.

The public automatic street-call is the last on my list. It is the simplest system next to what I term the direct message. Of course, I know that private automatic fire-calls or telephones can be laid on from dangerous risks, and there has even been an instance where an attempt was made to give every householder a private fire-call. This system is, however, unfortunately too extreme for the municipal purse. If in connection with some other paying enterprise, as in the case of the messenger services referred to, it would be a different matter, though it should also not be forgotten that too great a number of call points means a probable repetition of signals to the same fire. As every call should be answered, two separate fires quite easily occurring about the same time in the same neighbourhood, there is a risk of too many sections of the fire brigade being unnecessarily on the road to one fire.

ENLARGING AND MAGIC LANTERNS.

"OPTIMUS" ETHO OXYGEN SAFETY SATURATOR.

Price complete with Jet, 70 - each.

FREDERICK E. IVES, of colour photography fame, said in a recent address:—"In my opinion the best of these inside-lantern Saturators yet produced is that of Perken, Son & Rayment, of London. . . . It will not become unduly heated in the lantern, as some of the others might, and is a model of compactness and convenience. I think so much of it that I have adopted it for my own use."

"OPTIMUS" 100 CANDLE-POWER LAMP.

Price, Three Wicks 2 in. wide, with Lantern complete, 65 - each.

Nature.—"Lanternists will be glad to learn that Perken, Son & Rayment have introduced a new oil lamp, possessing THREE TIMES THE CANDLE-POWER of those hitherto used for lantern projection. For small audiences the lamp will suit a lecturer's purpose quite as well as the limelight."

As to the position of call points, they should not only be conspicuous, but they must also be in most frequented positions. Maybe, in some towns, a point in front of a church would be the best; in others, it may be more advisable to have them in front of a public house or cigar shop. It should always be remembered that every facility should be given to enable as many people as possible knowing the whereabouts of the call points without any distinct effort on their part. Red paint may make a call pillar conspicuous by day, and a coloured lamp is necessary by night.

As to the indication I spoke of, the plate on every letter-box as to the whereabouts of the nearest call point is perhaps one of the best. The letter-box is one of the most used instruments of a modern city, and the plate is hence read by many. In an oriental town the public fountain would however, of course, take the place of the letter-box. Plates put up inside every front door are somewhat extreme measures. In one city I saw small red darts painted on the glass of every street lamp indicating the direction to be taken to come across a street alarm. This sign, however, has the disadvantage of requiring a previous knowledge of its meaning. It is generally useless to a stranger in the town.

As to rewards paid to messengers, I know them to vary from one shilling to half a sovereign. In some places every call is rewarded; that is to say, also those to chimney fires, and this often results in an abuse. I have actually known rogues to light bogus fires on the top of a chimney, and then run to call the engines. If a reward be given, a limitation should be made. In one town I know no relation or employé of the owner receives a reward. In other cities no rewards are, for instance, given for calls to a fire in a dustbin or a chimney. As to the amounts paid, of course it depends on the value of money in the respective countries.

Here I must add a few words as to false alarms. No true fireman would be annoyed at a false alarm given by mistake. The possibility of a fire, or the suspicion of one, are *bona-fide* reasons for a call which should not be discouraged. Malicious alarms should, however, be treated with the utmost rigour, as the absence of firemen from their stations always means an extra risk to life and property. More, distant helpers may arrive too late. Combined lynch law with imprisonment has been adopted with good effect in one city I know. The rascal when caught was put over the pole of the engine and thrashed with a broad fireman's belt, and after that he was handed to the police. Hard labour has had much effect, especially also

inflicted on persons of position. Only a short time back the son of a well-known mayor had a month's hard labour for a malicious call, and there was at once an abatement of the evil. Fines are a ridiculous punishment for this kind of offence. They almost encourage the monied imbecile or ruffian. Where the punishment for malicious alarm is severe, there need be no recourse to the semi-public automat I spoke of, excepting perhaps in the veriest slums of a city.

The fire-call should, if possible, also be so constructed as to facilitate intercommunication between the scene of a fire and the headquarters of the fire brigade. Where the runner is employed or the telephone is used no special arrangements are required, but where the telegraph or automatic call point have been introduced, the apparatus must be adapted for this contingency. At some automatic fire-call points a few signals can be given, at others a telegraph or a telephone transmitter can be applied. Much valuable time may be saved in this way when more assistance is required. On the other hand, I again know towns that make a point to keep up a line of intercommunication for every fire, so that in case of an emergency part of the men in attendance there could be called away to help elsewhere. By-the-by, in some places the headquarters of a fire brigade are in communication with some watchmen on a neighbouring tower or steeple, who can signal any increase in a large fire by the change of light the blaze shows.

The organisation of fire brigades is most varied. As to the hours of duty there are brigades where officers and men are practically constantly ready to attend a fire, others where they are ready on alternate days, two days out of every three, or three days out of every four, and the off day is entirely their own, or at the most only partially used by the authorities for some light work. The men off duty are only expected to attend a fire if there is a great emergency. The brigade is strong enough without them for ordinary eventualities. Both systems can be worked with or without part paid or volunteer reserve. These would be only called out for great calamities. They could be organised as practically independent reserve force, or the reserve men might be attached to sections of the regulars and mixed with them when the occasion arises, in the same way as our naval reserve men mostly are. The reserves can either consist of retired firemen who have a few regular drills, or amateurs who have to go through a special course of training with some regular drills at intervals and preferably a short spell of service every year with the regulars. I prefer the reserves to be a distinct body. As regards the hours of duty

GOLD MEDAL, Inventions Exhibition, 1886.

for the regulars, forty-eight on to every twenty-four off has given the most satisfactory results.

As to the division of the active force it may be on a system of a number of small parties of twos and threes backed by one or more strong bodies. Another system allows for a division into sections of equal strength (so-called "units"), ranging from parties of say from five men with a non-commissioned officer to thirty non-commissioned officers and men with an officer. The force can of course also simply be divided up into parties or sections of different strength not governed by a system of military units; the sections or "units" can either work independently, simply governed by one central authority, or they can be grouped into minor or major bodies (so-called districts or companies), which are as a whole responsible to headquarters.

As to the officers, they may be all taken from the ranks, or they may be officers and gentlemen in the military sense who have only temporarily done work with the rank and file when in training. There could also be a combination of these two systems. Only the captain and deputy-captain might be officers in the military sense, the sections or divisions being officered by non-coms. Some cities have an officer to every thirty non-coms. and men, whilst others put a division of as many as two hundred men under a fireman who has risen from the ranks. Where protection is treated as a science, and where those in charge of a brigade have really to act as advisers to their employers, officers in the military sense have been found essential. They have also been found advantageous where their scope is limited to fire-extinguishing. The prestige of the fire service has been raised everywhere where the officers, besides being fire experts, are educated men of social standing. There are cities where the officers of the fire brigade are in every way recognised as equal to army or navy men, their social position is the same, and their mess fulfils the same functions as a regimental mess. The fire-brigade officer is recognised at court, and there is no ceremonial without him. On the other hand, there are also cities, with brigades several hundred strong, where the captain, who may of course be a very fine fellow, would, unfortunately, seem quite out of place in any recognised club-room. His social standing would only be par with that of a colour-sergeant. As to the primary training of a fire-brigade officer, I may as well say that the best men have generally had some experience in another profession, such as the army, the navy or the architectural and engineering professions previous to

their entering the fire service. Some brigades recruit from army officers only, and preferably from the Royal Engineers or artillery regiments; others recruit from among architects and engineers, subject to their having at least had some military experience in the reserve forces or the volunteers. Some cities always only take engineers or architects, and make a point of it that they should have no previous military experience. I hold that some previous experience in the handling of men is essential. Royal Engineers and architects of some military experience have, to my mind, nearly always made the best officers.

As to the men, there are cities where only trained soldiers are taken as firemen; others where the engines are manned by sailors. In some towns the building trades supply the recruits; in others, all trades are either discriminately or indiscriminately represented. I have generally found a combination from the army or navy and the building trades most satisfactory. The knowledge of building construction in the ranks does the force good stead, and has already saved both lives and property. Where a brigade can boast of a few men of each important trade much money has been saved the ratepayers by the men doing their own repairs and refitting, but the number of men from sedative trades should not be excessive. Where there are only men of one trade or calling I generally found too great an aptitude for one-sidedness, and a wonderful amount of prejudice.

(To be concluded.)

CONTRACTING FOR CORPORATION WORK IN GLASGOW.

At their meeting on the 27th ult. the special committee of the Glasgow Police Commissioners on Standing Orders had under consideration the motion submitted to the commissioners by Mr. Main, to substitute in lieu of standing order 16 as presently existing the following article, viz.:-

"No member of the commissioners shall by himself or by a firm or company with or without limited liability, of which he is a member or shareholder, contract or sub-contract for any goods or furnishings to be made or supplied, or for work to be done, to or for the commissioners. The foregoing prohibition of business dealings with limited companies shall be held to apply only to private companies which are here defined as companies whose shares have not obtained an official Stock Exchange quotation in Glasgow, Edinburgh or London, and as

regards limited companies which have obtained such Stock Exchange quotation, the following modified resolution shall apply, viz:—No committee of the commissioners shall have any transactions with any such company in which a member of committee is a shareholder, or accept from any such company of which a member of committee is a shareholder an offer to contract for any goods, furnishings or work to be made or supplied or done to or for the commissioners. Neither of the prohibitions in this standing order shall apply to shareholders in newspapers or in any railway company, bank or insurance company."

The committee having heard Councillor Main in support of his proposal, resolved, after full discussion of the matter, to recommend that the standing order as presently in force be adhered to, said standing order being as follows, viz:—

"No member of the commissioners shall, by himself or by a firm of which he is a member, contract for any goods or furnishings to be made or supplied, or for work to be done, to or for the commissioners. No committee of the commissioners shall have transactions with any corporate or limited liability company of which a member of the committee is a shareholder, or accept from any such company an offer to contract for any goods, furnishings, or work to be made, supplied or done to or for the commissioners—shareholders in railway companies, Scottish banks, insurance companies and newspapers excepted."

Mr. Main dissented from the recommendation. The committee also considered the following proposed addition to the standing orders by Mr. Garey, which was remitted by the commissioners to this committee on the 19th ult. :—

"No person who shall have been a magistrate or councillor shall be appointed to any office or emolument in the gift of the commissioners before the expiration of twelve months after he shall have ceased to be a magistrate or councillor."

After discussion, the committee agreed to recommend that the proposal be negatived, Mr. Main dissenting.

Mr. Main said that he wished the committee to take back the matter for further consideration, and moved that the committee should be increased.

Dr. Garey seconded.

Bailie Graham did not see why the matter should not be discussed now, and he moved accordingly.

This was seconded.

On being put to the meeting, thirty-one voted for the amendment, and twenty-four for the motion to remit the matter to the committee.

Mr. Main, in opening the discussion, said that this question was not a new question. The very principle which he was asking should be adopted was actually the finding of the Town Council two years ago. At that time Treasurer Gray declined to vote, or probably the present standing order would not exist. He saw no reason why he should participate in profits arising out of his connection with the Town Council, and he had such faith and confidence in the great majority of the members that he was sure they would affirm this principle. He moved that the motion standing in his name in the minutes should be adopted.

Dr. Garey seconded Mr. Main's proposal. As it was a recognised principle at that board that all members must be debarred from any position of profit or gain in connection with any of its transactions, the commissioners would be only consistent if they did what they best could in order to carry that principle into effect. Mr. Main's amendment simply detailed the principle already accepted. So far as the addition to Mr. Main's proposal which stood in his (Dr. Garey's) name was concerned, he submitted that it was only an additional detail to Mr. Main's amendment. He (Dr. Garey) did not claim to be the originator of the idea contained in his proposal. He found it in the standing orders of the Edinburgh Town Council. He did not pretend to say that the Glasgow Police Commissioners were in the same position as the Edinburgh Town Council were when the latter adopted it. When the idea first occurred to him he was not aware that any member of the commission was likely to come within the pale of its operations.

Treasurer Gray moved that the old standing order 20 should be adopted. It was to the effect that no member of Council should contract for any goods or furnishings to be made or supplied, or for work to be done to or for the Council, or should be concerned, directly or indirectly, in any contract with, or participate in any manner in the profits of any work to be done for or goods to be furnished to the Town Council. The common law of England, he said, was against any members taking Corporation work, directly or indirectly. He trusted they would revert to the position in which they were until the false charge was made two years ago.

Mr. Dickson seconded Treasurer Gray's proposal.

Bailie A. Murray asked Mr. Lang if Treasurer Gray's amendment, if adopted, would prevent the commissioners from contracting with a limited company of which one of the commissioners was a member.

Mr. Lang ruled that it was not competent for Treasurer

Gray to introduce his motion as an amendment to Mr. Main's proposal.

Mr. Shearer pressed for an answer to Bailie Murray's question.

Mr. Graham pointed out that the discussion was irregular. Proceeding to support the minutes, he said that he did not think that it could be said of any member of the commission that the firm with which he might be connected had received any distinct advantage from the Town Council from the fact of his having been connected with that particular company.

Mr. W. F. Anderson said that he thought that if members were excluded from deriving profit from Corporation contracts, the rule ought to be binding all round. The Corporation ought to be above suspicion. He contended that the standing orders at present in force were abused, and urged that commissioners who were members of a private company, or of a company whose shares were not quoted on the Stock Exchange, had no right to sit at the Council board and derive a farthing of profit from any Corporation contract.

Mr. Crawford said they were trying to set up a standard of morality of their own which the law did not recognise. They were wasting their time in this discussion in making standing orders that went beyond the law of the land. Why, then, if they could not enforce anything, should they bother their heads about standing orders which, so far as they went beyond the common law, were absolutely ineffective and futile? He would ask Mr. Lang whether or not the statement he had made as to the common law was correct, and if so, why should they waste their time in minute criticism of the standing orders?

Mr. Lang remarked that Mr. Crawford's statement was correct.

Mr. Ferguson said that a court of honour was a higher court than a court of law, and he thought that the finger of scorn pointed at a man who would value his duty on such a matter after it had been resolved upon by his colleagues would be quite powerful enough to produce the desired result. He was thoroughly in sympathy with Councillor Main on this matter. He would like, however, to put himself right, and to ask a question. Supposing he sold paper to a stationer, and the stationer supplied the paper to the Council, would he (Mr. Ferguson) be unable to be upon the committee? He did not think so himself. At all events, he would like no dubiety about the matter. He had much pleasure in supporting Mr. Main's motion on a clear understanding on that point.

Mr. D. M. Stevenson asked if some of the gentlemen who

took Mr. Ferguson's view would tell them how to distinguish between a Stock Exchange company and a non-Stock Exchange company, because there were plenty of private companies quite as big as many Stock Exchange quoted companies.

Mr. James Dick thought that in all the discussion they had only been looking at one side, namely, the corrupting of the members of the Council by taking contracts. Mr. Main's amendment would certainly take from the Council the power of accepting contracts which even in a secondary way any member could be interested in. If such a condition was passed it was utterly impossible to carry through the work of the commission.

Mr. John Macfarlane remarked that Mr. Main had not grasped the meaning of his motion. A wholesale oil merchant who was a member of the Council might sell oil to a retailer who might sell it to the Corporation Tramways. The member would be unseated.

Mr. Main asked permission to make an explanation, and proceeded to make some remarks.

Bailie Graham rose to a point of order, and observed that Mr. Main was entitled to make an explanation, but not a speech.

Mr. Main pointed out that the case as instanced by Mr. Macfarlane was not prohibited by the clause.

A proposal was made to adjourn the discussion until the next meeting, but in reply to a question, Mr. Lang said that the matter had been fully discussed and should go to the vote.

A division was then taken on the portion of the minutes referring to Mr. Main's proposal, when thirty-three voted for the minutes, eighteen for Mr. Main's amendment, and nine declined to vote.

THE CHOICE OF AN ENGINE.

ON the 1st inst., at the meeting of the South Staffordshire Institute, Mr. J. W. Hall read a paper on "Conditions which Determine the Choice of a Steam-engine." He stated that the purchasers of engines were most apt to err in their choice under any given circumstances, either in paying too much attention to the first cost of the plant, to the exclusion of the other factors, or, less frequently, in considering nothing but the coal bill. The former error was more common in this neighbourhood, the latter in Lancashire and on the Continent. It was commonly taken for granted that a cheap engine meant a

tolerably high fuel bill, and that to economise fuel a very costly engine was requisite. Did the cost begin and end with the engine, there would be some reason for this view; but the engine and boiler must be regarded as one installation, and the cost of the whole as the basis of comparison. It needed no proof that an engine using 60 lbs. of feed per indicated horse-power required very much larger boilers than one using only 15 lbs. for the same power, yet it was curious how often the point was lost sight of. The higher the pressure of steam a boiler would supply, the higher was the economy of fuel it was possible to obtain from it, the limit of increased pressure being determined by prudential considerations of safety, of first cost and wear and tear. The question of the best pressure to adopt was the first to be settled, as upon that everything else turned. This economical pressure was not the same in every instance, but it was in all cases steadily rising, as boilers more suitable for higher pressures were obtainable. The inclination to employ higher speeds, which, under suitable conditions, were also conducive to economy of fuel, was quite as noticeable as the tendency to work at high pressure; and now that most of the difficulties experienced in the earlier days—to which much of the prejudice still existing in many minds against high-speed engines was undoubtedly due—were successfully overcome by more suitable design and proportions, and the use of a better class of material, the original objections to them had entirely disappeared. No engine could be considered fit to run at high speeds which was not fitted with sight feeds, or at least continuous or automatic lubrication, to every bearing, by which it could be constantly supplied with oil while running for days and nights together, without any necessity to stop for greasing; indeed, as much care and thought was now spent by the designer on the lubricating details as upon any other part of the machine. As increasing the revolutions made by an engine in a given time increased its power in the like proportion, high speeds enabled smaller engines to be used for the work: and though doubling the speed did not quite halve the cost of engine per unit of power delivered, owing to the fact that higher speeds required larger bearing surfaces, the economy in first cost was very great. Of all methods of reducing initial condensation, the most practicable and convenient was the employment of the steam in a series of cylinders, whereby the range of temperature in each cylinder was much reduced, and condensation and evaporation brought down to a minimum; and experience proved conclusively that a compound

engine was in all cases, at all pressures likely to be employed in these days, more economical in the use of steam than a single engine using the same pressure and number of expansions. During the last ten years a type of engine, formerly almost unknown, had become very common, that was the compound condensing engine, which, particularly for engines of small size, proved exceedingly economical. It was very commonly assumed that a compound engine having two cylinders was necessarily a costly one, but for given power it frequently was cheaper than a single cylinder, and, seeing that the amount of steam consumed was less, the boiler might obviously be smaller. There was another important advantage in compound engines—namely, the much smaller relative loss of efficiency due to leakage past pistons and valves when the engine was worn. When an engine was liable to a sudden temporary demand for power much in excess of its normal output, a single cylinder met the difficulty well, and with the lowest first cost; but anything approaching economy was impossible in this case unless an automatic cut-off was employed. Marine engineers found that triple engines cost rather less to make than compounds, and they less again than single engines, reckoning boilers and everything in; while shipowners reported that the smooth running of the three-cylinder engine saved so much in wear and tear that they were less expensive to keep up.

THE DRAINAGE OF HOWTH, CO. DUBLIN.

THE following report from Mr. Stoney, engineer to the Dublin Port and Docks Board, on the drainage of Howth, has been received by the Board of Guardians of the North Dublin Union, acting as the Rural Sanitary Authority:—

In compliance with your request that I should say whether I consider Messrs. Ross & Collen's plan for Howth drainage capable of being practically carried out, and fully effecting the purpose for which the plan was designed, I beg to report as follows:—As this reference extends the scope of the former one, it will be necessary for me to express my views at somewhat greater length, and, perhaps, more freely than otherwise I should have felt warranted in doing, in order to put you in possession of such information as this further question seems to demand. The drainage of the north side of Howth may be divided into two

150 HOPE STREET, GLASGOW

distinct classes — namely, that of the villa residences, chiefly detached or semi-detached houses, built on the sloping hill side, and that of the town itself, mainly consisting of Fish Street and Main Street, the houses in which are, with few exceptions, not supplied with modern sanitary appliances, and the inhabitants of which for the most part throw their slops and refuse into the street in front of their dwellings. The slops flow down the water-tables into the nearest gully-trap, and the more solid refuse is removed by carts. Any new system of drainage in Fish Street will do little to alter the existing outward state of affairs. The inhabitants will still throw their refuse and slops into the street, and to ordinary observation there will be no appreciable change. The only alteration will be that the present underground system of drainage will be modified, and I doubt if it is worth going to immediate expense for this change. Under these circumstances frequent cleansing of the thoroughfare is fairly good practice, and should be carefully attended to. If this view be adopted the new sewer in Fish Street will be eliminated from any immediate scheme of drainage. My own experience of Howth (extending over several years) leads me to say that the better class of houses are the chief offenders. From these, especially when furnished with water-closets, considerable quantities of noxious slops are discharged, and these generally find their way into the nearest watercourse, contrary to the Rivers Pollution Prevention Act, and it is not pleasant to see milch cows drinking such polluted water, or that our senses should often remind us that civilisation is not unattended with certain dangers to which our ancestors in primitive times were probably much less exposed. Having premised so far, I shall now return to the plan of Messrs. Ross & Collen which, in my first report, I said I considered the best of the four competitive designs; and here I may observe that competition rarely produces a very complete or final plan, especially when the prize is insufficient to warrant much expenditure in its preparation. You have, however, in the selected plan the nucleus of a good system of drainage, and when further labour is spent on details the resulting modifications will doubtless greatly improve the design. Some of these I have mentioned in my former report. I may now add that I think the line of sewer between Cannon Rock House and the entrance gate of Nashville Park may advantageously be diverted to the public car road leading from Cannon Rock House to Main Street. First, because the line shown on the plan will be nearly entirely in rock cutting; secondly,

because villa residences are much more likely to be built close to the public road than close to the line shown on the plan; thirdly, it will fit in better with the drainage of Main Street. Next, I think it probable that the drain along Boggeen Lane can be omitted, for careful examination may show that the sewerage from the direction of Rosemount to Springmount can be carried into Boggeen Road sewer, which joins the main line of sewer from Kitestown to the sea. Again, I think that probably the direction of the outfall might be slightly altered with advantage; but, as I have already suggested, your engineers will, on more careful examination, doubtless find several matters capable of improvement — matters on which I have not sufficient information to enable me to express an *ex cathedra* opinion. What I wish, however, to convey is that the villa residences are the houses which create the chief nuisance, and if these are provided with public sewers it will be easy to drain Main Street also, leaving Fish Street alone for the present, at all events. Main Street sewer also can be readily flushed throughout from the Boggeen brook. I have heard the opinion expressed that an open sewer is less unhealthy than a covered one. I do not agree with this, but that perhaps is a matter of taste. At all events, the system of cesspools which largely prevails in Howth is not unattended with danger, especially if wells are in their vicinity, and though the inhabitants claim exemption from typhoid and other sewage diseases, and are, with reason, proud of the purity of the air, this should not prevent precautionary measures being taken in time, and before there is a much greater increase of villa residences, for it is rather late to set one's house in order after a pestilence has broken out. In conclusion, I may remark that no sewage scheme ever is perfect, and it would be absurd to expect a rural sanitary authority to provide means for draining every house within an improved district. To illustrate this I may refer to Mr. Sydney Wright's house at Kilrock. This charming villa is so far below the probable level of a sewer in the road above that it is expedient to let it continue to drain directly into the sea as at present. Somewhat similar cases will occur elsewhere, where an isolated residence may be allowed to continue its present system rather than incur large expense in order to carry out a theoretically perfect system of drainage. I think, therefore, I may say that the selected plan, when modified as I have proposed, and with such improvements as further investigation may suggest to your engineers, is capable of being practically carried out and effecting the purpose for which it was designed.

INSTITUTION OF JUNIOR ENGINEERS.

At a meeting of this Institution held on December 7 at the Westminster Palace Hotel, Victoria Street, Mr. H. J. Young in the chair, a paper on "Waterworks and their Appliances" was read by Mr. William Mallock. There was a large attendance of the members.

Dealing first with source of supply, the author described generally the formation of the soil over or through which the rain passed on its way to the two classes of source—above ground and under ground, and reference was made to the systems adopted by the larger cities throughout the kingdom for obtaining their supplies. Diagrams were exhibited showing the arrangements and appliances in connection with London waterworks for well-sinking, boring and driving headings into the chalk to the underground sources. The supply derived from London wells was gradually being exhausted, as was proved by their fall of water-level to the extent of 10 inches average per year; the above-ground source of supply would, however, be sufficient for many years to come. The geological formation of the Thames watershed, comprising an area of 3,500 square miles, was described, from which it was noticed how, on account of the extensive natural filtration it undergoes before passing to the river, the Thames water was so much purer than the river waters of the north country, where the soil was generally impervious and therefore unfitted for filtering purposes.

In considering the question of storage, to which great importance was attached, various schemes were investigated applying to London, including Hunter & Fraser's, which had been accepted by the Royal Commission, and a proposal of the author's, whereby pumping expenses would be avoided and other advantages obtained.

A detailed account followed of the latest practice in regard to the different appliances in connection with the processes through which the water passed from the intake, through screens, subsidiary reservoirs, filters, pumps, service reservoirs, valves and mains, to the consumer.

The paper concluded with some remarks on waste-prevention, which could best be secured by the adoption of Deacon's meters. They were being largely used by the more advanced water companies, and resulted in a great saving, in many cases of as much as over 50 per cent.

In the discussion which followed, Messrs. R. W. Newman, Walter Hunter, F. L'Estrange, F. Fisher, B.Sc., W. Powrie, S. Boulding and others took part.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

22859. John Charles Pickard, for "Racket for window blind cord."

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 P.M. on Thursdays.*

NO. 1 HOLLAND PARK, W. RESIDENCE OF MR. VAL PRINSEP, R.A.

TRADE NOTES.

THE new Board schools, Bulwell, Nottingham, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE Kirkcaldy municipal authorities have decided to erect a new three-dialed illuminated clock on the tower of Pathhead Hall, the cost of which, with the necessary alterations, is estimated at 150*l*.

THE Easthampstead Rural Sanitary Authority have accepted the tender of Messrs. R. Holmes & Co., of Chesterfield, amounting to 6,535*l*., for the sewerage works at Bracknell. The works include two small pumping stations and storage tanks. The engineer to the scheme is Mr. W. H. Radford, C.E., of Nottingham, whose estimate for this part of the work was 7,000*l*.

A NEW illuminated turret clock has been made and erected in Hayfield parish church by Messrs. W. Potts & Sons, of Leeds & Newcastle, the donor being Mr. J. Dack, J.P., Hayfield.

WE have received from the London and Lancashire Fire Insurance Company, 45 Dale Street, Liverpool, a handy wall calendar for 1895. On the back of the card is given information so often needed for reference at a moment's notice as to postal arrangements, stamps for agreements, &c., income and property tax, &c. On the back of the removable sheets will be found memoranda forms for each month. The face of each sheet shows the day of the week and month at a glance, and they are carefully printed in two colours, blended, each sheet differing in tints. The changes of the moon are given, with other information as to holidays, feasts, &c.

WE give a list of tenders for the construction of an underground convenience, &c., for the Lambeth Vestry. The work

will be carried out at the expense of the Vestry, under the superintendence of their surveyor, Mr. James P. Norrington. The busmen's shelter and waiting-room were designed by Mr. R. Cruwys, architect, Brixton, acting for the freeholder.

LAST week we published a list of tenders for the rebuilding of the Jamaica Bridge, Glasgow. The bridge committee of the Town Council have selected the tender of Messrs. Morrison & Mason, the estimate being 81,176*l* 5*s*.

AN artistic collection of designs for casement fittings has been put together in a very elegant form by Mr. Henry Hope, of Lionel Street, Birmingham. A sheet has been, in each case, devoted to the separate illustrations. In the introduction Mr. Hope says:—To meet the demand for casement fittings, artistically designed and executed in the best possible style, I have produced the casement latches which are illustrated in this book. All the photographs are taken from the casements themselves, and the general finish on all orders for this class of work is guaranteed equal to these. The designs are mostly adapted from existing examples, and a great variety of these can be supplied without extra cost. These illustrations are given as specimens of workmanship and design, and I shall always be pleased to work out architects' sketches, and give full-size drawings for approval, before putting the work in hand. The specimens illustrated give a good idea of the excellence of the work produced by Mr. Hope, both as to design and finish.

BUILDING AND BUILDERS.

AT Tipton arrangements have been completed for the erection of a new post-office for the Horseley Heath portion of the parish. The site has been purchased by the postal authorities from Mr. W. W. Doughty. The building will be of red Ruabon brick and terra-cotta, with a frontage to Horseley Heath and Horseley Road of about 100 feet.

THE death is announced of Mr. Alderman Harris, of Okehampton, aged only thirty-five years, who carried on an extensive business as a builder and contractor. Mr. Harris was one of the charity trustees and an overseer for the borough. He leaves a widow, but no family.

MR. J. T. SMITH, of Whitcomb Street, has prepared plans for the rebuilding and extension of the King's Head Hotel, Harrow. The works and furnishing will cost about 16,000*l*.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (*i.e.* the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

ORDINARY BURNERS, 50 calories per candle per hour.					COAL GAS.				
ARGAND	"	44	"	"	"	"	"	"	"
					SIEMENS' BURNERS, 23 calories per candle per hour.				
					WELSBACH				

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

FOR FURTHER PARTICULARS, APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.,
14 Palmer Street, Westminster, London.

At a cost of about 250,000*l.* the Manchester Corporation have decided to carry out a somewhat novel scheme in the way of providing artisan dwellings. An overcrowded and unhealthy area in the centre of the city, containing about five acres, is to be cleared and blocks of workmen's dwellings erected thereon. Extensive spaces will be left for playgrounds, while the roofs of the buildings—in the construction of which novel features will be introduced—will be made flat and adapted as recreation and playgrounds, as well as drying-grounds. The open spaces will also be planted with trees and flower-beds arranged. Mr. John A. Langston, architect, Took's Court, Chancery Lane, the author of the scheme, writes that 250,000*l.* is required for buying the freehold, diverting the river Medlock and building the dwellings, independent of clearing the area.

The memorial-stones have been laid of new sewage works and a marine lake which are being constructed at Rhyll at a cost of 50,000*l.* The engineer is Mr. Baldwin Latham, and it has been decided to give the contract to Mr. Law, of Kidderminster.

ELECTRICAL.

The annual meeting of the Institution of Electrical Engineers was held in the hall of the Institute of Civil Engineers, Mr. Alexander Siemens in the chair, when Mr. R. E. Crompton was elected president. The report gave an excellent account of progress in finances, the number of members being over 2,300, and considerable sums had been transferred to permanent investments.

The deputation of the Glasgow Town Council who visited Budapest to inspect the electric tramways give 12,650*l.* as the average total cost of construction per mile of single line, the running expenses being stated as exceedingly low.

At the meeting of the Manchester Association of Students of the Institution of Civil Engineers Mr. C. H. Wordingham, A.M.Inst.C.E., read a paper describing the Manchester electric-lighting works. Mr. A. Ross, president of the Association, occupied the chair. The author first referred to the interest excited among engineers by the Manchester electric supply on account of its magnitude and importance, and more especially

because of the five-wire system decided upon by the engineer. It was interesting to note that the St. Pancras Vestry were on the point of converting their three-wire into a five-wire system. Mr. Wordingham said considerable extensions were contemplated for next winter, and there was every indication that this would be the largest municipal station in the kingdom.

The illumination of Electric Avenue, Brixton, began on Tuesday evening, the 18th inst., to December 24, inclusive, on a much more extended scale than any of the previous Christmas illuminations produced there. The street is about 600 feet long by 44 feet wide. The avenue will form one vast stage, where at stated times in the evening the most beautiful prismatic effects will be created by the constant changes of the coloured lights, thereby producing results both startling and beautiful, and giving the public additional proof of the unique possibilities of electricity.

VARIETIES.

The Dewsbury and Heckmondwike Water Board have approved the draft of a Parliamentary bill proposing to borrow 190,000*l.*

The *Leeds Mercury* says:—Of the two sites suggested by the Hull Corporation for the proposed municipal buildings, the Paragon Street to Prospect Street site will provide the town with a public square in Prospect Street about 900 feet long by 150 wide. This square would be larger than Trafalgar Square, London; St. George's Square, Liverpool; or George Square, Glasgow, and by arrangement with the infirmity authorities, 30,000*l.* worth of open land in front of the infirmity would practically be given to the town free.

The State apartments and the Albert Chapel at Windsor will be open to the public on Monday, December 24, and on Boxing Day. The hours of admission will be from eleven till three o'clock.

At Southport a partial collapse has taken place on the pier, near the Pavilion, owing to several supporting pillars being swept away. The recent high tides overflowed the new carriage-drive made by the Corporation, and a rush of water, receding through the overflow pipes, had cut a channel in the

sands from 6 to 18 feet deep, with the result that the pillars of the pier were undermined and gave way. Communication with the extreme end of the pier, which now resembles a switchback railway, is entirely cut off, and the damage is estimated at several hundred pounds.

EFFORTS are being made to raise 25,000*l.* to carry out needed improvements on the Sussex County Hospital.

NEW CATALOGUES.

MESSRS. BAIRD, THOMPSON & Co., Limited, of Charlton Engineering Works, Islington, are issuing their new catalogue, 1895, of ventilating, warming, drying and other specialties in which they are specialists. Their new edition contains a very large number of new and artistic designs suitable for all classes and styles of architecture, and cannot fail to commend itself and prove of great value to the profession. From the continued success of their specialties and the facility afforded at their new works, this company are now enabled to turn out their appliances more expeditiously and at a great saving of cost, in consequence of which an important reduction has been made in their prices. The whole catalogue is a work of art and reflects great credit on this enterprising company. The following are some specialties:—Ventilators, automatic and mechanical; extractors and inlets, electric ventilators for all purposes, air propellers, belt driven or with high speed engine; water motor, compressed air motor, also by electricity; compressed air system of ventilation, warming and drying, also cooling; waterspray system of ventilating and cooling, smoke flue ventilators, artistic improved chimney cowl (slightly and effective), improved systems of heating by steam, hot-water and hot-air, Plenum system of combined ventilating and warming for all classes of buildings, new and improved drain-testing apparatus, new and improved dry or earth closets, &c.

REFUSE DESTRUCTION.

LAST week we referred to the "Incinerator" (Dr. Sergeant's patent), manufactured by Messrs. Manlove, Alliott & Co., Limited, Engineers, Nottingham. This invention is meant to deal with all kinds of refuse produced at hospitals, asylums, prisons, workhouses and public institutions. The "Incinerator" is a furnace specially adapted for the destruction or purification by fire of either fluid or solid refuse. The destruction of refuse

by fire is acknowledged by the most eminent sanitary authorities to be the only safe method of dealing with such objectionable matter. Refuse has been known to produce disease when allowed to remain on the premises, and when removed to a distance the public health has suffered elsewhere. Much expense is saved in the cost of cartage in towns where Fryer's destructors are in operation, and in some cases the heat generated by the burning refuse is so employed as to become a source of revenue. For smaller requirements the "Incinerator" has been devised, and in it the most dangerous class of refuse, pervaded with the most infectious matter from hospitals, &c., is got rid of by the most perfect and economical method, complete combustion of vapours being insured and no foetid smells allowed to escape. It is suited for small and for large institutions, and can be erected at a small expense and requires little attention.

THE CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

At the opening meeting of the session of this Society the president, Mr. C. T. Walrond, read his address, and took for the subject of it the latest development of various branches of sanitation. Mr. Walrond began by drawing attention to the fact that the increased attention now being bestowed upon sanitation was largely due to the rapid growth of towns. He then referred to the improvements in the chemical treatment of sewage which are taking place. Next some recent forms of precipitation tanks were described, the "Candy" tank being specially alluded to, and its advantages for the ready removal of sludge without the necessity of drawing off the sewage or interrupting its flow were specially pointed out. The Webster process for the purification of sewage by direct electrolysis, the Hermite system of treating town sewage, not in bulk, but in detail, by a supply of electrolysed sea water laid on to every town for disinfecting purposes, were described. To the latter system he saw serious objections. The Scott-Moncrieff system of bacteriological purification, which opens up prospects of a revolution in present methods of sewage-disposal in the near future, was then considered.

Mr. Walrond passed on to the subject of the use of distributors in getting rid of town refuse; then to recent methods of preventing the filtration of water into or out of sewers; to the increased use of the transmission of power from central stations for automatically raising sewage; and to

the problem of sewer ventilation, the key to which appeared to be, in his opinion, the diminishing of the number of ventilating openings, regulating their size, and using artificial means for extracting foul air from the sewers, for which latter purpose the exhaust air from "Shone Ejectors" could be usefully employed.

Coming to the question of house drainage, the speaker recommended that soil-pipes, as well as drains, should be subjected to tests by the surveyors to local authorities, and urged the desirability of an authoritative set of standard tests and conditions, compliance with which would entitle a house to be registered according to its sanitary state, the register to be open to the public on payment of a small fee.

The address was discussed, and a vote of thanks to the President closed the meeting.

FIRE PROTECTION.*

(Concluded from last week.)

I SUPPOSE I need really not specially mention that physical strength and a perfect constitution are requisite for both officers and men. As to the height of the men, I can only say that I have found small, wiry men to come in very handy. First-class eyes, ears and nose are necessary, also a good memory. There is one point I must here not omit, and that is, that many brigades only take single men; non-coms. and officers are only allowed to marry. As to age, there are many brigades where twenty-two and forty are the limits for the privates, fifty for the non-coms. and sixty for the officers.

As to the equipment, there are brigades which have all their sections or units provided with practically the same gear; others where each unit has a double or treble set, one of which is used according to circumstances. The section may have a manual engine, a steamer and a ladder truck at its disposal, and may turn out with either. Then there are towns where the units are differently equipped, and we find steamer or manual sections, called out as the case may be. In a few extreme cases where the sections are very strong, they may be equipped with a set of engines and trucks, and the unit in every case turns out complete with, say, a manual, a steamer and a horsed escape. The contrast to this will be found in the small parties of twos

or threes I referred to, whose turn out would only consist of a small horse trolley or an escape. Of course there are all kinds of combinations. I have known sections to have one or more independent sub-sections. Though practically belonging to the "unit," the sub-sections would work independently in charge of a certain gear, say a hose car, a long ladder, a fire suit, or a smoke helmet, according to circumstances. The sub-sections may also act as outposts—if I may call them so—as a station guard, or simply as specialist parties, which are only called out for particular work.

As for the housing of the units or sections, there are the simple street stations for the small parties referred to. In a few cases I have known two small parties to be under the same roof. The large bodies that back them are generally quartered together in extensive barracks, from which any number of engines and men can be turned out according to the nature of the call. Then there are cities where every section has its own well-built station; others where one or two sections are housed together, according to circumstances, and perhaps as many as half a dozen located at headquarters. If groups are formed, the headquarters of the group or district perhaps has two sections, while each of the other stations only have one. The general headquarters may be the central station of a district at the same time. The actual working of the district headquarters would, however, then be kept separate from the working of the headquarters staff. The latter would, perhaps, have some sections ready to send anywhere, besides the trucks—necessary for the officers—any general extra gear, &c., that might be required. It is usual to combine workshops, stores, hose drying towers, &c., with the headquarters station, and in some cases also with the district centres.

As to the distribution of stations, the formation of districts, &c., various systems have been adopted. The most satisfactory results have been obtained where a fully-equipped section (not simply a hose-car or escape party) can reach any building in the city within seven minutes from the time of the call reaching the station, the seven minutes including for both turn out and run. Where there are exceptionally large or dangerous risks this time has had to be shortened to five minutes, and the possibility of an attendance from a second station assured within eight minutes. In dividing up districts the most satisfactory results were obtained where every house could be reached from the district centre within fifteen minutes from the call. Headquarters would naturally have a central position in the city. In one or two instances I have known the head-

quarters offices to be located in a separate building, which in no way served as a fire station, but simply as a centre through which all orders and business passed. I am no friend of this arrangement.

The different stations must of course be in connection with each other. Excepting in the one city already referred to, the special runner or rider has practically disappeared. Telegraphy and telephony take their place. Some cities favour Morse telegraphy. It certainly had great advantages over the telephone till within a year or so, as messages could be easily transmitted to several stations with the same effect, but telephone distributors have now been successfully introduced. Errors are, I believe, less frequent by telegraph than through the telephone, and there is always a record of every message. The most modern forms of telephone communication are, however, more suitable for the fire service than the telegraph, though I should by no means advise the great expense of their introduction where there is a good system of the older kind. Headquarters should be in direct communication with every station, but every station should be able to communicate with its neighbour directly, as well as through the headquarters office, and there should be a direct wire to its district station if it has one. There should be three routes of communication, so that two would be always ready for use in case of one breaking down. Either headquarters of the district centres would be in touch with the various auxiliaries referred to, as well as the general telegraph office and the telephone exchange.

As to the attendance at fires, some cities always only turn out one unit to answer the first call if they have no particulars, others always turn out two or three sections, and there are several cities that I know where the district centre would at least send an officer and a few men as well. In one brigade headquarters is always either represented by the chief or second officer in the case of a call of this kind. The idea is that it is always better to have too strong a force quickly in attendance than too small a number of men, and that it is omni-important that the first arrivals should be well handled. Further, if two sections answer a call and one breaks down on the road, there is no chance of there being too great a delay in the arrival of organised help. It should, however, as I said, not be forgotten that further calls in the same district to other fires are not unusual, and that the absence of too many engines on account of a first call is dangerous. In some cases when a call reaches the firemen one or two of the nearest stations turn out, and if

more help is required other sections will be called up individually. In others the reinforcements are not called up separately, but the fires are divided into three classes, small, medium and large, and on the message arriving of a more extensive conflagration, the sections always know beforehand if they must attend or not. First calls to certain classes of risks, say theatres or public offices, may always be considered to be for medium or large fires, and the same message will then simultaneously turn out the stronger body without any further detailed instructions having been necessary. In two towns I know the fire-call automats are so arranged that the messenger can already call for the different classes of fire. This is, however, not to be recommended, as an excited messenger will probably consider the smallest fire to be a gigantic blaze and will turn out too many engines.

It is quite impossible for me to here enter into a description of the appliances or working of brigades. Besides requiring some considerable time, I should have to describe a number of institutions individually, and that is not my intention now. I will only point out that where there is a high-pressure water-supply some brigades simply attend with hose cars, life-saving gear and ladders, or instead of the hose cars take their manuals, which they never use. Others take and make a point of it to use the manuals, and have a barrel with them ready to supply the first gallons of water necessary. Time is thus not lost in connecting with the nearest hydrant or plug, and in case of a hydrant being out of order there is always sufficient water at hand until the second hydrant has been found. Some cities always have an attendance of steamers, which are, however, only used in urgent cases. In other instances the steamer is once used in the same way as the manual, and this quite independent of the pressure there is in the water service. Where there is no good water service, manuals or steamers of course have to be sent out, and are either used off the low-pressure service or off the natural water ways or wells. Of course there are yet a large number of cities where the suburbs have no proper water service. The water barrel comes in very handy here for portage.

As to life-saving and manœuvring gear, some brigades rely almost entirely on long ladders, scaling ladders or telescopic escapes. In one city I know great confidence is placed in the jumping-sheet, in another chutes are much used, and there are a few where wonderful work is done with life-lines. Simply to indicate the diversity with which any one appliance can be treated, made or handled, in the fire service, I would mention

that there are quite ten different ways in which a jumping-sheet can be held. Then there is the material of the jumping-sheet to be considered, the size and the shape, if round, oblong or square, then the means of holding it, the way to fold it, how and where to stow it, and at what distance from the endangered building the sheet is to be held. Last, but not least, come the words of command.

As to the working of brigades, I must limit myself to saying that there are, first of all, forces where all possible attention is given to the actual rapid turn out, whilst there are others where the speed at which engines are run to the fire is considered to be of primary importance. Other brigades, again, give equal attention to both. There are brigades which work entirely on military lines, each man having certain duties marked out for him beforehand for every possible occasion, and there are others where happy-go-lucky working is preferred. Of course there are combinations in the same way as regards command. I know one chief officer who always arrives at a fire with a staff of adjutants and orderlies and controls the working of his brigade from a position of vantage at a distance. Another chief of a strong brigade always delights to be in the thick of a fire, perhaps at the branch itself, or on some gallant life-saving exploit where he no doubt does good work as a fireman, but in no way fulfils the office of a commander. Officers must remember that they are officers and not rank and file, and this is generally very difficult to those who have advanced from the lowest grade. Superintendents, however smart, must leave acts of bravery to their men, and chief officers, without going to extremes, must always be in a good position where they can superintend everything pertaining to the outbreak in question. Some brigades seem to make a point of it to work quietly, and shouting is absolutely barred. All commands are here given by shrill whistles. In some brigades all commands are given by word of mouth and there is much bawling. In others commands besides being bawled are even repeated on horns, and the noise becomes ridiculous. As a rule, quiet working is a sign of efficiency.

Some brigades work as close as possible to the fire, others are satisfied with putting water on or about the fire from a distance. Some attack the fire direct, others only try to protect what surrounds the seat of the flames. In several brigades the orders are to always try and attack by the natural routes of the front door and the staircases. In others, the men always have to attempt some more unnatural entrance, with the aid of ladders—through windows, for instance. Some brigades care-

fully extinguish a fire, some simply swamp it. I know cases where officers will go so far as to let a roof that is alight burn itself out, simply keeping the surrounding walls, or say attic floor, damp. This prevents unnecessary water damage. The roof will have to be renewed any way; why, also, spoil a number of rooms below? Handled by judicious officers, several brigades have been able to boast of never having damaged property unnecessarily. They have, for instance, had the patience to suffocate a cellar fire instead of putting the whole cellar under water. In certain classes of property the bucket, the hand-pump and the mop have been far more effective in minimising actual destruction than hose, which can ruin more by water than the damage by fire would have. It is one of the easiest signs to judge the training and handling of a fire brigade by to see what damage they do. Even an inconsiderate smashing of doors and windows, when there is absolutely no need for it, can be avoided, where every man in the force feels that his first duty is to prevent damage and loss, and his second to extinguish the fire.

Where the brigade includes a salvage division, it is generally stationed at headquarters; where this division is split up into sections, there would also be a distribution among the district centres; the salvage men are simply part of the force, told off on special duty. Where there are private salvage corps, their stations are generally near the headquarters or district centres of the brigade, from which they receive notice of the fire. In some cities the salvage corps work quite independently; in others they work under the chief of the brigade directly they arrive at the fire.

I am afraid I cannot even touch on the working of other auxiliaries excepting to say that there are a number of cities where the advantage of firemen having plenty of room to work in is fully recognised, and the police are at once called out with the fire brigade and brought on to the scene in an incredibly short time. There are always vans ready horsed at the police headquarters to take out a squad of men when the fire-call comes, and a certain number of mounted men are also kept ready for this purpose. The value of these measures should not be underrated, especially in cities prone to rowdiness or political demonstration. If the firemen are unpopular their work will be doubly difficult for them. By-the-by, there is, however, one thing I cannot omit, and that is to point out the value of firemen being trained ambulance men, especially in such localities where independent ambulance corps do not attend fires.

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in
large quantities for Greenhouse Sashes, Public-house Shutters,
and other heavy work. The Manufacturers would recommend
it for its strength, and the large amount of wear in it, con-
sequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND
LINES (two Prize Medals awarded). The Manufacturers of
the above articles particularly wish to draw the attention of
the trade to their Imperial Patent Flax Sash Lines, of which
they are now making six qualities, all of which they can
strongly recommend, as they have given unqualified satisfac-
tion to the trade for now over One Hundred Years, and the
Proprietors continue to give their personal attention to the
manufacture of these goods.

They also invite the particular attention of the trade to
their IMPERIAL PATENT BLIND LINES, which are very
superior to anything yet offered.
They can be obtained of all Rope-makers, Ironmongers,
Merchants, Factors and Wholesale Houses in town and
country.

BUILDING DIFFICULTY.

IN the Scottish Courts the Second Division disposed of an appeal by George Todd, wholesale hardware merchant, 71 to 85 Candleriggs, Glasgow, against a judgment of the Dean of Guild Court, Glasgow, in a petition by the appellant for a warrant to execute alterations on subjects owned by him on the north side of Wilson Street, Glasgow, being the flat immediately above the shop No. 10 Wilson Street. John Wilson, C.A., Glasgow, judicial factor on the trust estate of the deceased Thomas Forrest, rope and twine manufacturer, as proprietor of the shop No. 10 Wilson Street, and of the basement flat, lodged objections. The objector said the tenement was originally built for occupation as shops on the ground-floor and dwelling-houses above, and access to the upper flats of the tenement is obtained by a common stair entering from the close, No. 12 Wilson Street. The gables at the east and west ends of the tenement are not mere gables but form part of the tenement itself. The flues or chimneys for the fireplaces in the objector's shop pass up through the gable forming the eastern wall of the tenement. The petitioner, he said, proposed to break through the two gable walls separating his present warehouse from the flat above the petitioner's shop, and to use the flat for the storage of goods. The petitioner's stock was of an inflammable description and hazardous from an insurance point of view, and the result of the petitioner occupying this additional flat would be to subject the objector's shop to additional risk of fire. The objector pleaded that it was incompetent for the proprietor of one flat of a tenement to connect it with the adjoining building by cutting through the intervening gables. The petitioner pleaded that being the sole proprietor of the portion of the gable through which the proposed entrance was to be formed, and the alteration being safe, he was entitled to decree. Dean of Guild Guthrie Smith sustained the objections and refused the lining with expenses. The Second Division, on appeal, recalled the Dean of Guild's interlocutor, and granted warrant with expenses.

Lord Trayner, who delivered the leading opinion, said:—The appellant is the proprietor of certain heritable subjects in Wilson Street, Glasgow, described in the petition as "the flat immediately above the shop No. 10 Wilson Street." He is also proprietor of the tenement or part of the tenement immediately to the east of that first mentioned, and he has made application to the Dean of Guild for warrant to carry out certain alterations on these properties, conform to plans produced. One of the proposed alterations is to make a connection between the two

properties by breaking through a doorway or passage in the gable walls of the two properties respectively, and thus enabling the petitioner to have direct access to the flat above No. 10 Wilson Street from his property lying to the east thereof. The respondent, who represents the owner of the shop No. 10 Wilson Street, objects to the proposed alteration on two grounds embodied in his pleas in law, which are as follows:—(1) It is incompetent for the proprietor of one flat of a tenement to connect it with the adjoining building by cutting through the intervening gables. The alterations proposed being unsafe, the petition ought to be dismissed. The Dean of Guild has sustained the first of these pleas and refused the lining craved. He has not dealt with the second plea in so far as it covers the other proposed alterations, that being unnecessary in the view on which he has proceeded. I am of opinion that the judgment of the Dean of Guild is erroneous and ought to be recalled. The Dean of Guild has proceeded upon the authority of the case of *Gellatly v. Arrol*, which he regards as a decision ruling the present case. No doubt that case presented some features of similarity to the present; but the two cases are distinguished by this very material circumstance, that in *Gellatly's* case the interference with the gable which was held to be illegal was an interference which resulted in injury to the vents or chimneys in the gable belonging to the other proprietors; whereas here no such injury is alleged on record, and it was admitted at the bar that no such injury would be inflicted by the appellant's proposed operations. In the opinions delivered by the judges in *Gellatly's* case there are other considerations referred to and which perhaps affected the decision; but the real ground of judgment was that the operations there complained of were illegal in respect they were an invasion of the legal rights of others. So regarded, the decision in *Gellatly's* case does not rule the present. I am not prepared to admit that the proposition set forth in the respondent's first plea is necessarily and in all cases a sound statement of our law. If it were it would impose a restriction on the rights of property which so far as I know has not yet been imposed by our law, and a restriction which would prevent a proprietor making a use of his property which might be advantageous to himself and yet in no way injurious to his neighbour. If the gable in question had been the common property of the different proprietors in the tenement the case would have been different, because there can be no interference with common property except by consent of all the proprietors. Such, however, is not now regarded as the character of the right which the several

Office: 175 Strand, London, W.C.

proprietors of a tenement have in the gable walls of their property, although that view found favour with at least one of the learned judges who decided the case of Gellatly. My opinion is that the operations on the gable proposed by the appellant are operations *in suo*, and, not affecting the rights of any others, ought to be allowed. I should therefore be disposed to recall the judgment appealed against, repel the respondent's first plea in law and find that the appellant is entitled to the lining and warrant prayed for in so far as concerns his proposed alterations on the gable walls. As the objection raised by the second plea in law covers a matter of fact set forth in the sixth article of the objections for the respondent, with which the Dean of Guild Court has not dealt, the case, so far as that point is concerned, will require to go back to him.

INSTITUTION OF CIVIL ENGINEERS.

At the ordinary meeting, Sir Robert Rawlinson, K.C.B., president, in the chair, the paper read was on "Colliery Surface Works," by Mr. E. B. Wain.

As an instance of the development of mining operations during the past twelve years, the North Staffordshire coal-field was cited, where the output had been increased 40 per cent, and this was due to the fact that there was hardly a colliery in the district the plant of which had not been considerably improved during the period referred to. Under the varying conditions consequent upon the increasing depth at which it was necessary to work the coal the work of laying out the surface works was said to have been one of evolution, and comparisons between such works and those laid out recently on modern principles for a definite output would probably indicate much waste and inconvenience resulting from spasmodic and desultory extensions. It was of the highest importance that the works should be concentrated as far as possible, so as to permit efficient supervision and to reduce the staff of mechanics and general labourers. An example case was mentioned of a colliery where, in 1876, six small and scattered plants were at work on the property, and were raising less than one-half of the material now being obtained from two shafts. As the plant at each shaft required its staff of engine-men, stokers, pit-banksmen and foremen, it was evident that great economy was effected by reducing the number of such establishments. In the instance mentioned, the reduction in surface charges effected by concentration was 4.67d. per ton.

Where practicable, the railways should be arranged so as to allow a gentle descent for the waggons to and from the screens; if the nature of the ground would not admit of this, endless ropes working between the rails were of great service. In no case ought dead-end sidings to be used if a regular output was to be maintained, as the loss of time in shunting waggons would cause serious hindrance to the coal-winding. It was also desirable that each quality and size of coal should be delivered on a separate road, so as to allow of continuous loading. In a set of colliery sidings so laid out, the cost of shunting was only 0.09d. per ton, or about 0.5d. per ton per mile. The author was of opinion that it was not advisable to undertake new work of importance in colliery workshops, but to use them simply for the purpose of making such repairs as might be necessary. In districts where there were good engineering works near to the collieries, even a portion of the repairs might with advantage be sent out; but where there were not facilities for doing it near at hand, it was of the highest importance that all tools and machinery for maintenance should be provided at the colliery. Where practicable, the workshops should be built on a level with the pit-bank, and light tramways of the same gauge as that of the underground roads should be provided to facilitate the transport of material from the shops to the pit-shaft. The particulars were given of a range of workshops used at a colliery raising 2,000 tons per day, with details of the construction of the safety-lamp room and cost of cleaning, &c., lamps. Creeper-chains, gravity roads and balance cages worked in connection with double-deck pitbank platforms were described; also Fowler's hydraulic arrangement for use where more than two decks had to be changed. The most convenient size of pit waggons was discussed, a gross weight of 18 to 20 cwt. being mentioned as the maximum which might be conveniently handled. Four types of tiplers—the ordinary back tiplers, Rigg's and mechanically worked end-and-side tiplers—were described, the side tiplers being considered the most generally useful.

The subject of screening and picking apparatus would, in itself, afford material for a lengthy paper; the author, therefore, only briefly noticed some of the types of screen in general use. In laying out the heapstead, it was important that there should be sufficient height between the pit-banks and screen-siding levels. The height would vary considerably according to the type of screen and the number of sizes desired. In general practice it was found that fixed bar-screens with not less than 20 feet was required, if the coal was to be separated

into three sizes, whilst with jiggering screens it was possible to do the same work with 16 feet where no picking-belts were wanted. Fixed bar-screens were said to be objectionable on account of the steep gradient and consequent breakage of the coal in screening. Mechanical screens might be classed under three heads:—First, revolving barrel screens; secondly, endless-belt screens, such as the Lührig belt and the Greenwell screen, and, thirdly, jiggering screens. For dealing with a large output from a tender seam, containing a high proportion of small, the author advocated end-driven jiggers with a flat gradient and driven by cranks or cams with a throw of 4 to 5 inches, working at about 100 revolutions per minute. The Greenwell screen, suitable as serving both as picking-belt and screen, was noted as being specially advantageous where little elevation was available. The particulars were given in a tabular form of several modern winding plants, with the speed of winding the average load, and the maximum possible quantity which could be raised per shift of eight hours. As example, a net load of 52 cwt. of coal was raised 550 yards in 44 seconds, with an average speed of $37\frac{1}{2}$ feet per second, and a maximum speed of 60 feet per second. Under such circumstances all complications in the winding-engines must be avoided. With the higher steam-pressures now used, there should be, however, no difficulty in taking advantage of compound working, provided the high and low-pressure cylinders were both duplicated. Owing to the variable load due to the decreasing weight of the rope in ascending and the increasing weight in descending winding-engines were generally wasteful in working. There were various contrivances to balance the load, but the best and simplest was a plain balance rope worked with a parallel drum. The economy of fuel in colliery work had received too little attention in the past, the boilers being often supplied with inferior coal or slack which had been considered unsaleable. The amount of coal consumed in colliery work was probably not less than 5 per cent. of the total output of the kingdom, and as slack had now become more valuable, colliery engineers were beginning to give greater attention to the questions of compound working, expansion gear, condensation and balanced loads. The engines had been, as a rule, designed to admit steam into the cylinder for almost the whole length of the stroke. Although such an arrangement enabled the inertia of the load to be more easily overcome in starting, the back-pressure was considerable in the cases of engines running at high speeds, and it was by no means uncommon to obtain from engines working at 80 lbs.

per square inch diagrams giving a back pressure of 10 lbs. per square inch. The general practice was now, however, to cut off steam at about 20 per cent. before the end of the stroke. Condensation, as applied to modern winding engines, could only be said to have reached the experimental stage, but it was probable that independent surface-condensing apparatus, to maintain a steady vacuum, would be largely used in the future in colliery works.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

22407. Samuel Gratrix, jun., & Brother, Limited, and Henry Brocklesby, for "Improvements in or applicable to flushing cisterns."
 23469. John Thomas Tennant, for "Improvements in flushing apparatus for water-closets and the like."
 23473. Herbert Edwin Baden, for "Improvements in water-closets."
 23526. Isaac Barnsley, for "Improvements in the construction of baths, traps for baths, lavatories and other purposes."
 23626. Daniel Keith and William McGeoch, jun., for "Improvements in and relating to window-sash frames."
 23709. William Barraclough and Albert Rhodes, for "Improvements in and relating to fireplaces."
 23795. Moses James Adams, for "Improvements in sanitary closets."
 23808. Richard Ames, for "Improvements in machines for manufacturing drain, sewer and like pipes."
 23814. William Mockett, for "Ventilation of main and other sewers."
 23819. Charles Bristow, for "Improvements in surveyor's adjustable centreing rod."

WINTER, WARMTH AND COMFORT

HEATING AND VENTILATING APPARATUS. GRUNDY'S SPECIALTY. PURE WARM AIR.

UPWARDS OF ONE THOUSAND TESTIMONIALS RECEIVED.

PURE WARM AIR AS SUPPLIED TO

Truro Cathedral; Londonderry Cathedral; Sherborne Abbey; Kilmore Cathedral; Stanley Cathedral, Falkland Islands; Cardiff Catholic Cathedral; the Queen's School Chapel, Eton; Cork Asylum; Leicester Asylum; and to upwards of three thousand Places of Worship; and a great number of Mansions, Houses, Hotels, Hospitals, Schools, Warehouse Factories, Workhouses; Cork Law Courts, &c., &c.

84 Brook Street, Grosvenor Square, W.: December 8, 1893.

Sir WILLIAM BROADBENT encloses cheque for the "GRUNDY" HEATING APPARATUS supplied to his house, and is glad to say that has proved very satisfactory for warming and ventilating as required. The principle of the apparatus is most excellent. To Mr. Grundy.

PROFESSOR TYNDALL writes:—

October 24, 1893: Hind Head House, Haslemere.

Dear Sir,—My house being so well provided with grates and flues for the generation and distribution of pure warm air, I have been enabled to spend my winters in England instead of on a foreign shore.—Yours very truly,

JOHN TYNDALL.

Fever Hospital and House of Recovery, Cork Street, Dublin: October 26, 1894.

Dear Sir,—I have much pleasure in informing you that we have found your HEATING APPARATUS a great success in our new Epidemic Hospital, which consists of a two-story building, each story containing two large wards, a smaller isolation ward, and two nurses' rooms. It easily managed, does not cost much for fuel, and the air entering is most pleasant, warm, and free from smell. It is with the full concurrence of the Managing Committee I give you this testimonial. Yours faithfully, JOHN MARSHALL DAY, Registrar and Resident Medical Officer.

THE
Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TRADE NOTES.

WE have received from Mr. Robert Hammond a copy of his pamphlet on electric light. It has been drafted to give concisely all possible information in regard of municipal lighting.

WE hear that the National Accident Prevention Window Co., Limited, of 34 New Bridge Street, Ludgate Circus, owing to the large increase in their business, have had to provide themselves with more extensive premises. The address of the company's offices and showrooms is now 159 Victoria Street, Westminster, S.W.

WE are informed that Messrs. Cassell & Co. have recently arranged to reissue Mr. Stevenson's "Treasure Island" in their boys' paper *Chums*, with new illustrations expressly executed.

THE Board Schools, Silloth, Cumberland, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

WE learn that Comyn Ching & Co., Castle Street, Long Acre, have been successful in obtaining the contracts for providing and fitting up the elaborate steam and gas-cooking apparatus for the kitchens in the new Post Office buildings in St. Martin's-le-Grand, on the same principle as already supplied by them at the G.P.O. at Birmingham, Newcastle-on-Tyne, and the new Parcel Post Dépôt, Mount Pleasant, &c.

THE Leeds School Board have had placed a new eight day illuminated turret-clock for the Hunslet new Board School, one of the most thickly populated manufacturing parts of the city of Leeds, which will be a great boon to the inhabitants. The work has been carried out by Messrs. Wm. Potts & Sons, clock manufacturers, of 13 Guildford Street, Leeds, and Newcastle-upon-Tyne.

THE Queensferry Bridge committee have received tenders for the work of putting a bridge over the Dee. Twenty-five tenders have been received from leading engineering firms in various parts of the country.

At the special meeting of Greenock Harbour Trust it was agreed to proceed to Parliament with a Bill to alter and extend the powers of the trustees of the port and harbour of Greenock in relation to the warehousing of goods, and for other purposes.

VARIETIES.

AN inquiry has been held at the Salford Town Hall on behalf of the Local Government Board, with regard to the application of the Salford Corporation for sanction to borrow 30,000*l.* for gasworks purposes.

AN application has been made to the Local Government Board by the Lancaster Corporation to borrow 62,000*l.* for constructing a second reservoir, capacity of 126 million gallons, and the inquiry has been held. It was stated that 133,000*l.* had been already spent on the water-supply.

THE *Leeds Mercury* says:—From several competitive schemes that of Mr. A. E. Preston, of Bradford, has been selected. By its adoption the sewage of Pateley Bridge and Beverley will be conveyed by pipes down the valley for a distance of about a mile and a half, where, after passing through filter arrangements, it will be disposed of by irrigation. The probable cost of the sewage scheme is 6,000*l.*

THE Secretary of State for Foreign Affairs has received from Her Majesty's agent and consul-general at Sofia a copy of an invitation for tenders for the works to be undertaken in connection with the harbour at Varna. The total cost of these works is estimated at 8,300,000 francs (332,000*l.*), and a deposit of 415,000 francs (16,600*l.*) will be required. The adjudication will take place on February 11 (January 30) next. The copy of the invitation to tender may be seen on application to the Commercial Department, Foreign Office, between the hours of eleven and six. Any further information may be obtained from the technical committee of the Railway Department in Sofia.

AT the meeting of the Bournemouth Town Council the Mayor read a letter from Sir George Meyrick's solicitors, in which it was stated that Sir George would be willing to hand over the cliffs to the borough as pleasure-grounds, providing the question of an undercliff drive was finally settled, including the approval of plans and estimates showing the scheme to be feasible, and further, that he was prepared to contribute to the cost, but to what extent would depend very much upon what the cost of the scheme would be. The cost has been put at various estimates, from 60,000*l.* to 100,000*l.*

AT the meeting of the City Commission of Sewers a report was brought up from the finance and improvement committee relative to the communication from the County Council as to the widening of Thames Street and forming a northern approach to Tower Hill. They recommended that it be

147 STRAND, LONDON, W.C.

intimated in reply that the Commission would be prepared to enter into the arrangement suggested by the County Council, viz. that the Commission should carry out the City portion of the approach to Tower Bridge, estimated to cost 63,050*l.*, the County Council paying half, and the Council also contributing one-third of the cost of the improvement in Thames Street estimated to cost 37,500*l.* The adoption of the report was agreed to.

At Birkenhead a Local Government Board inquiry has been held into an application by the Corporation for sanction to borrow 20,000*l.* for electric lighting, 10,000*l.* for works of street improvement and sewerage, and for fencing in the Bridge Street depôt, and 5,000*l.* for the erection of a fire station and the purchase of a steam fire-engine and appliances.

The special committee of the Glasgow Town Council for carrying out the building of the East End Palace have decided to alter the site from the foot of William Street to a place on the Green near Monteith Row, the latter being a much more central site.

A SERIOUS subsidence has occurred at Marton, in the Cheshire salt district, on the farm of Mr. Moreton. A large lake was formed some years ago by subsidence. Six hundred additional square yards of land have now gone down, closing a public footpath and entailing serious losses on the landowner and tenant.

ONE of the largest of the chimney stalks belonging to the Burntisland Oil Company has been taken down. The stalk was 160 feet high, and owing to the top portion having become dangerous, it was deemed advisable to take the whole structure down. The method adopted was to wedge up where the bricks were displaced at the base and saturate the wedges with paraffin oil and ignite them. Just as the workers had finished operations and were approaching to set fire to the saturated wedges the structure was observed to sway, and it went tottling down on to the refuse heap behind the works.

At the meeting of local members of the Institution of Mechanical Engineers and other prominent engineers of the city and Clyde district, held in Glasgow, Sir Renny Watson presided, and stated that the Institution proposed to hold the summer meeting of 1895 in Glasgow, under the presidency of Professor Alexander Kennedy. The chief business of the meeting was the appointment of an executive committee, and accordingly a list of names of representative engineers of

Glasgow and the Clyde district was drawn up and adopted, subject to the consent of the gentlemen nominated, and with power to add to their number.

A DESPATCH has been received from Her Majesty's Consul at Rio Grande do Sul reporting that the State Government will receive before January 18, 1895, tenders for the improvement and maintenance of the navigable channels between the Rio Grande bar and Porto Alegre, as well as the Sangradouro channel in Lake Mirim and those about the Pelotas bar. The plans can only be seen at Porto Alegre, Rio de Janeiro, Montevideo and Buenos Ayres. This notice is published in case any contractor in the United Kingdom may wish to tender through his agent in South America.

THE CEMENT TRADE AND ADULTERATION.

THE cement trade recently held a meeting at the London Chamber of Commerce for the purpose of receiving and adopting, or otherwise, certain recommendations of the special committee which had been appointed to investigate and report upon the extent of the practice of admixtures with Portland cement, and as to the justifiability thereof. The trade, with only one dissentient, adopted the recommendation of the committee, that it was advisable that all manufacturers of Portland cement who have used any outside material or materials in the manufacture of that article should at once discontinue the practice. The use, however, of not more than 2 per cent. of gypsum, as practised by the German manufacturers for the purpose of regulating the setting of the cement, is considered optional. Messrs. Stanger and Blount, who are experts, have been instructed to report early in January, if possible, on the admixtures with Portland cement on the Thames and Medway, and the extent to which they are used.

THE COUNTY COUNCIL AND THE WATER COMPANIES.

EIGHT Bills are to be promoted by the London County Council next session for the acquisition of the metropolitan water companies. Relating to the New River Company, the preamble of the Bill recites the Acts which govern the company's supply and the districts which are included within its limits, and

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of 3½ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

SIEMENS' BURNERS, 23 calories per candle per hour.

ARGAND

14 Palmer Street, Westminster, London.

tates that "the rates of charge which the East London Company are authorised to demand are higher than those authorised in the case of the New River Company, while the East London Company do not supply water up to the same height as the New River Company are required to supply it, and the rates of charges which the West Middlesex Company can demand are considerably less than those of the New River Company;" that "the New River Company are supplying water within a portion only of their district, and the East London Company are supplying within part of the New River Company's district at higher rates of charge to the consumer, and the New River Company are also supplying within part of the West Middlesex Company's district at higher rates of charge than the West Middlesex Company would be authorised to make." The conclusion is that it is expedient that, in default of agreement between the Council and the company, the undertaking should be transferred to the Council. The Bill then goes on to enact that the transfer shall take place on December 31, 1895, or such other date as may be agreed upon, that the transfer may be by agreement as to terms, or, failing agreement, "on such fair and reasonable terms, having regard to all the circumstances of the case, as may be determined by arbitration." The arbitrators are to be chosen one by each of the parties, and may, if necessary, appoint an umpire or engineer, barrister, solicitor, surveyor, accountant, or other person, having special knowledge of any of the matters referred to arbitration, to act as assessor. In determining the fair and reasonable value of the undertaking the arbitrators are to have regard to the following matters:—

"The condition and state of repair of the reservoirs, filter-beds, filtration arrangements, wells, mains, conduits, pipes, machinery and plant of the New River Company, and the probability of future expenditure thereon, together with any liabilities or obligations in connection with the water undertaking which the New River Company may reasonably be required or expected to incur.

"The legal powers of the New River Company to take water and the probability of such powers being limited.

"The adequacy and efficiency of the present sources of supply and of the reservoirs, filter-beds, filtration arrangements, wells, mains, conduits, pipes, machinery and plant of the New River Company to meet present and future requirements.

"The probable necessity of the future introduction of a new source of supply, or new and improved works.

"The legality of the charges now made or claimed to be

made by the New River Company, together with the circumstances under which such powers of charge have been granted by Parliament.

"The deductions from any compensation claimed by the New River Company which may in the opinion of the arbitrators be reasonably made in respect of any insufficiency of the present storage or filtration of the New River Company, or in respect of the provision of supplementary supplies.

"The deductions to be made in respect of works plant or appliances which have become wholly or partially useless, and the adjustment of the revenue account of the New River Company in respect of repairs and renewals properly chargeable thereto.

"The statutory powers of any other company to compete in any other part of the New River Company's district, and the rights of any other company or body to supply water in the New River Company's district, whether as now existing under statute or otherwise, or as may be likely to exist in the future.

"The effect of the amendment of the New River Company's Act of 1852, and the incorporation of section 35 of the Waterworks Clauses Act, 1847, with the New River Company's Acts."

No allowance is to be made in respect of any claim by the company to divide profits in respect of "back dividends," or in respect of any assumed future increase of the rateable value other than an increase due to alterations or additions involving increased supply of water, and no addition is to be made to the fair and reasonable value of the undertaking in respect of compulsory sale. It is also provided that if the Council so require the consideration to be paid for the transfer should be in the form of a half-yearly or other periodical payment charged upon the county fund for a period of not less than 80 or more than 100 years. Power is proposed to be given to the Council to inspect the accounts and works of the company; the officers of the company are to become the officers of the Council, and in case of the abolition of any office the existing occupant is to be compensated. Provision is also made as to the supply of districts outside London and for selling portions of the works to any other local authority.

The other Bills dealing with the East London, West Middlesex, Lambeth, Kent, Southwark and Vauxhall, Grand Junction and Chelsea Water Companies respectively are on much the same lines, with this difference, however, that they omit the provision with respect to the consideration being paid half-yearly over a series from 80 to 100 years.

LEAD IN WATER.

AT the last meeting of the Yorkshire medical officers of health at Huddersfield papers were read on the subject of lead in potable water. The first paper was by Dr. Evans (Bradford), who pointed out the chemical action of water upon lead service-pipes, and said that if lead were dropped into carefully-distilled water and left for a time, at the bottom would be found a white precipitate, which, on examination, was found to consist of oxide of lead and hydrate of lead, generally known as oxy-hydrate of lead. The solution of this in the water was a subsequent process. This oxy-hydrate of lead, he believed, was due to the action of the oxygen in the water upon the lead pipe that might be exposed to its influence. But, it might be asked, "Where did the oxygen come from?" because the water was not decomposed. He had come to the conclusion that the oxygen was produced by being actually dissolved in the water itself, while it might also be due to the presence of oxidising agents in the water itself, however carefully distilled. Dr. Whitelegge (West Riding County Council), who followed, said he had been watching for the last two or three years, experimentally and otherwise, the action of a number of water-supplies upon lead, and the results differed in some cases from those that they were entitled to expect from the accounts of early experimenters. In many of the experiments made erosion had been completely lost sight of. He agreed that the water they had most trouble with was the acid or moorland waters, and many peaty pools were the most active of all. The action, however, was by no means limited to acid or soft waters. The power of some waters could be removed by the addition of chalk, and of others by the addition of carbonate of soda; but these two would not act in all cases, and they had to be careful about dogmatising on the matter. This question of erosion deserved more attention because there was no doubt that if water was left standing all night in a lead service-pipe, there was lead present in poisonous and dangerous quantities in the morning, so that the first flow of water ought to be always allowed to run to waste. He had come to the conclusion that there were many more public water supplies in the West Riding which acted upon lead than was at present suspected, and as medical officers of health they ought not to assume that the water under their charge did not act upon lead, but see by experiments whether there was not lead in solution. He had, he said, mentioned two methods of preventing water acting upon lead; but there was a third, and

that was by the treatment of filtration, though to his mind there was a tendency to assume that filtration could do too much. In conclusion, he urged more co-operation amongst medical officers of health in regard to this important question. Dr. Hunter (Pudsey), who spoke as one who had gone through a lead epidemic, pointed out that the lead deposits through drinking contaminated water were so slow as to cause an endless variety of symptoms. This accounted for mistakes in diagnosis which resulted in cases of plumbism often not being recognised as such. Blindness, weakness of the procreative organs, abortion, brain disorders, liver complaints and many other complaints of a fatal nature he had known to arise from the presence of lead in water, and at one time in Pudsey he had known the first flow of water in a morning contain as much as from half to a whole grain per gallon, and then plumbism was at its height. Dr. Swann (Batley), in his paper, pointed out that in the case of the lead-poisoning in Louis Philippe's family at Claremont, the water was found to contain seven-tenths of a grain per gallon and 34 per cent. of those who drank this water were affected. If this were the case, it was a matter which the public would have to face before long, whether they could go on taking water containing 1-100th of a grain for years with impunity. He instanced a number of cases of illness which he attributed to the lead in the water, and which disappeared when iron-piping was substituted for the lead-piping.

HANDSWORTH, BIRMINGHAM.

THE general purposes committee of the Handsworth Local Board has prepared a report on the growth of the district and the work of the Board since the constitution of the district in 1874. It states that the Urban District Council to be elected on the 17th inst. will on the 31st take over the work hitherto performed by the Board. On December 2, 1874, Dr. Welch, the medical officer of health, presented his first report to the Local Board upon the sanitary condition of the district, and pointed out the conditions which endangered the health of the inhabitants. At that time, even in the better class of residences, grave sanitary defects were often, if not commonly, present. The houses occupied by the working people were generally built in rows, back to back, or with windows and doors in one side only. The ventilation was therefore very imperfect. The cottages were built in the cheapest possible manner, the external walls being in many cases only $4\frac{1}{2}$ inches

thick, and damp. The drainage of the district was in the highest degree defective, the sewage matter in most cases being drained into dumb-wells sunk in the gardens and yards belonging to the houses, and the dumb-wells were often unemptied for years. The drainage of the district was surrounded by difficulties, and the earth, air and water were being polluted with sewage. At that time there was not a properly constructed sewer in the district, but the drainage from a considerable number of houses was carried into drains which had been laid for draining highways (which were unfit for carrying sewage), and through such drains found its way into watercourses. The Local Board as soon as possible proceeded to deal with the question of sewerage the district. All the streets in Handsworth which are built upon are now sewered, the total length of sewers in the district being $31\frac{1}{4}$ miles; and all the houses, except a few in the rural parts of the district, are connected therewith. The Local Board have borrowed and expended in sewage works 76,250*l.*, of which sum 25,200*l.* has been repaid. For the treatment of sewage from Handsworth and establishment charges, the Local Board paid the Drainage Board last year 1,650*l.* 11*s.* 2*d.* Nearly every street and road in the district has been widened and improved, 31,000 square yards of land having been acquired by the Board and thrown into the roads. There are about thirty miles of dedicated roads in the district. About fifty miles of footpath have been kerbed, channelled and paved. The Board have borrowed and expended 25,712*l.* in works of street improvement since June, 1876; 10,414*l.* of that has been repaid. In 1874 the number of street lamps in the district was 364; there are now 880, lighting about thirty-three miles of streets. In 1878 the Handsworth Fire Brigade was established, and in May, 1890, a branch fire station was established at Perry Barr. For four or five years after the constitution of the district, the Local Board met in a room measuring 16 feet 6 inches by 15 feet, in an old building in Baker Street, called the Parish Offices. In May, 1877, the Local Board purchased the Waggon and Horses Inn, with the land belonging thereto (the total area being about an acre), as a site for new offices, and shortly afterwards erected the present offices, lecture hall and public library buildings. The total cost of land, buildings, fittings, furniture, &c., was 20,662*l.*, of which sum 7,246*l.* 3*s.* 11*d.* has been repaid. The medical officer reports the health of the district has for many years been most satisfactory, and that the death-rate compares favourably with that of any neighbouring district. The report deals with the growth of railway and

tramway accommodation in the district since the formation of the Board; and with reference to the litigation undertaken it is pointed out that in every case to which the Board has been a party the court has decided in its favour, with costs. In 1888 the Board purchased and laid out the Victoria Park, containing 20½ acres. Shortly afterwards they acquired three acres of the adjoining land. They have recently entered into contracts for the purchase on favourable terms of 16½ acres of land from the Ecclesiastical Commissioners, and of 20½ acres of Mr. Philip Williams to extend the park. When it is extended its total area will be 60½ acres, and an additional entrance will be provided in Hamstead Road for the convenience of the inhabitants living in that part of the district. The public library was opened on May 1, 1880, and up to that time 5,150 volumes had been purchased, and the amount expended was 789*l.* 13*s.* 7½*d.* There are now upwards of 700 musical works in the library, and the circulation of those works last year numbered 2,178. On the opening of the library there were 120 books in the reference library. There are now upwards of 1,600. On the opening of the library there were 5,150 works on the shelves. There are now 11,000 on the shelves and in circulation. In 1885 a branch library and newsroom were opened at Perry Barr to meet the convenience of ratepayers living in that part of the district. The accommodation at the central library and newsroom being altogether inadequate, the buildings were in 1890 extended and remodelled, costing upwards of 2,000*l.* Thornhill House was rented as a technical school at 50*l.* per annum. Plans of the new technical school, to be erected on land recently acquired by the Board at the corner of Golds Hill Road and Stafford Road, were being prepared, and would shortly be submitted for approval. The Board have raised twenty-two loans, amounting altogether to 133,824*l.*, at low rates of interest. Of this sum 43,507*l.* 14*s.* 2*d.* has been repaid to the mortgagees, leaving 90,316*l.* 5*s.* 10*d.* the amount of principal still owing. The amount in the pound of the general district rate has not been increased for fifteen years. It is 3*s.* in the pound (per annum) including the free library and technical instruction rates. The rate is a low one, having regard to the character of the district and the public works which have been executed. The area of the district is 3,647 acres. Its population, according to the census of 1871, was 14,359. It is now 38,500. Rateable value of the district in 1874 81,859*l.*, and the assessable value 17,704*l.* The rateable value now is 167,352*l.*, and the assessable 158,629*l.* The death-rate was 17·5 in 1874, 19·5 in 1875, and 12·9 in 1893.

THE NAVIGATION OF THE SEVERN.

MR. E. D. MARTEN, engineer to the Severn Commission, has presented a report to the committee of works and finance and for general purposes on his visit to Paris, with a view to obtaining information as to the navigation of the Seine by sea-going vessels up to that city, and its bearing upon the development of traffic upon the Severn. Mr. Marten states that "from the sea to Rouen, a distance of about eighty miles by river, the Seine is tidal, with a working depth of 22½ feet. From Rouen to Paris the river is canalised, in a similar manner to the Severn between Gloucester and Worcester, by means of nine locks and weirs. The distance between Rouen and Paris, although only seventy miles as the crow flies, is no less than 150 miles by river, and yet, notwithstanding this extremely tortuous course and the fact that there is railway competition the whole way, about 4,000,000 tons were carried upon the river in this section in 1893, of which quantity only about 100,000 tons was local traffic not subject to railway competition. This section of the river has been more or less canalised for many years; but the work had been so imperfectly accomplished in the first instance that in or about the year 1878 works were carried out by which the minimum depth of the channel has been increased from an uncertain 5½ feet to 6 feet to a constant depth of 10 feet 5 inches. It will be seen that these works have, therefore, had much the same effect as those which have recently been carried out upon the river Severn between Gloucester and Worcester, where the depth has been increased from 6 feet to 10 feet, and I am glad to be able to state that the increased traffic resulting from the Seine works is eminently encouraging to all persons interested in the navigation of the Severn, as thus improved. The works have cost nearly 2,500,000^l, and have been carried out at the cost of the State. The river is now maintained toll free by the State, as it was also prior to the improvement works." After explaining various engineering details, Mr. Marten says:—

"I saw and learnt enough during my stay in France to entirely confirm my previous opinion that no engineering difficulty exists to prevent a line of sea-going steamers being built and worked forthwith to trade between Worcester and Paris and other continental ports, and that everything points to such a trade being profitable. The commodities carried at present from London to Paris are mainly pottery, horns, skins, iron, lead and leather; whilst the main export from Paris is sugar. If, however, a good trade from Worcester to Paris could be secured, back-carriage (at any rate for part of the return journey) would be found in flints from Shoreham, and china clay from Devon and Cornwall, which vessels returning from Paris would bring up to Worcester, where they could be stored in bulk at Diglis Rock, and forwarded on to the Staffordshire Potteries by canal in smaller quantities to suit the trade. At present large quantities of both of these commodities are used in the Potteries, but they are taken by sea to Runcorn on the Mersey, and there stored, and subsequently forwarded as required by Trent and Mersey Canal. Between Cardiff and Worcester the distance by water is about the same as by rail, namely, eighty miles, thirty-five of which are toll free. The Severn route, therefore, possesses enormous advantages in railway competition as compared with the Seine route between Rouen and Paris, so that if the latter can hold its own there is every reason to anticipate that a regular service of large barges, such as are now possible over the Severn route between Worcester and Cardiff, would command a considerable proportion of the heavy traffic now passing to and from the latter port and the Midland district." In conclusion, Mr. Marten says:—"I desire to state that although the information I obtained in France entirely confirmed the opinion I had previously held, that sea-going steamers of special construction might profitably navigate the Severn to Worcester, notwithstanding the existence of the Westgate Bridge, yet on the other hand it has strengthened the view which I have always expressed, that that bridge should be converted into an opening bridge at the earliest possible date. All that I saw and learnt proved beyond a doubt that the Westgate Bridge is a bar to any sea-going vessel, not of special construction, reaching Worcester."

THE Paisley Police Commissioners have instructed Mr. Moncur, the master of works, to prepare plans for the extension of the public baths in Storie Street.

LIGHT RAILWAYS.

A CIRCULAR letter has been issued by the Secretary of the Royal Agricultural Society of England to the members of that Society, referring to the fact that a conference on light railways has lately been held under the auspices of the Board of Trade, and a committee, on which the Society is represented, appointed to report upon the subject. It being desirable that the agricultural aspects of the question should be fully considered, the Council desire to receive any suggestions which the members may have to offer on the agricultural light railway requirements of any particular district in which they are interested, and a schedule of questions is given to which answers are desired. These questions are as follows:—“(1) Please state county or counties to which the subjoined observations apply; (2) district to be agriculturally developed, naming terminal towns, places or stations; (3) description of light railway considered most suitable; (4) the main line of railway, if any, with which a suggested light railway should have connections; (5) how funds for construction and equipment might possibly be provided—by local subscription, by rates or advances on the security of rates, or by a combination of these sources or otherwise; (6) any other observations likely to prove useful for the purposes of the inquiry.”

CONCRETE CONSTRUCTION—ITS PRACTICAL APPLICATION.*

THE practical application of concrete may be conveniently divided into four divisions, viz.:—(1) False work; (2) materials; (3) tools; (4) labour.

The second division can be usefully divided into four sections, viz.:—(a) Cement; (b) aggregates; (c) iron; (d) water.

DIVISION I.—False Work.—Concrete, in respect to false work, is unfortunate in comparison with other masonry, because it not only needs more expensive centreing whenever centreing is necessary, but it also usually requires cribbing, whereas other masonry does not.

This characteristic entirely prohibits its use in many cases where in all other respects it would be desirable, and it is therefore an obstacle to the more extended use of this valuable construction that should be minimised as much as possible.

* A paper by Mr. E. L. Ransome, read at the Convention of the American Institute of Architects.

Of late years I have met with considerable success by adopting systems of standard centreing and cribbing, which, while not of universal application, are of great use, permitting, as they have done, of the construction of floors and buildings that otherwise could not have been attained; but as this is of interest to the contractor rather than to the architect I will not enter into a detailed description thereof.

Great difficulties have often arisen from the swelling of the sheeting of the centreing or cribbing, caused by the wood absorbing the moisture of the newly-placed concrete. From this cause many arches have been lifted and broken, floors cracked and walls thrown out of line. By using sheeting-boards of a moderate width, say 6 to 8 inches, and bevelling one edge slightly, the boards may be put close together, and when expansion occurs the only effect will be to slightly crush the sharp outer edge of the bevel, without lifting or disturbing the concrete abutting or resting upon it, the widest side of such boards being of course placed facing the concrete.

This is such a very inexpensive, simple and unfailing remedy that from its conception I have used it in all cases, and since its use I have never had any trouble from swelling of the timber. Some such device as this is especially necessary in dry climates, also in light constructions, such as floors of but an inch or two in thickness, or hollow walls.

For standard centreing or cribs, if of wood, it is advisable to make them of planed lumber. The surface of the wood should be thoroughly coated with common thick kerosine oil before it is used for the first time, and before each subsequent use it should be brushed over afresh with the oil, or else with a paste made of castile soap and water. Fish oil is objectionable, as it is apt to injure the surface of the concrete, and linseed oil is generally too gummy for this purpose.

It may be accepted as a general rule that false work of light sheeting, well braced, is more economical than heavier planks with braces further apart. I am aware that this is not the usual practice.

The ornamental effects can be much more cheaply produced by recessed than by projected work.

Materials.—Under this head cement, by reason of its greater cost and active qualities, stands out pre-eminent. I will limit my remarks under this subdivision to Portland cement, with the exception of the following observation, viz.:—

That where rapidity of construction is not a great object and aggregates are unusually cheap, by the use of common lime, with or without some of the cheap native cements, pro-

HILL'S WHEEL-BOLT MORTICE LOCKS

NIGHT LATCHES, &c.**

JAMES HILL & CO., 100A QUEEN VICTORIA STREET, LONDON, E.C.

perly handled, work of a good quality and of astonishing cheapness can be made—one part of lime to forty parts of aggregates not being considered too little in some cases.

Portland cement, a giant from its birth, is striding rapidly along in the way of improvement in quality and price, so that formulas of tests that were thought severe a few years ago would not be considered sufficiently exacting at the present time to insure as first class the cement that would successfully pass them.

The current technical literature teems with methods of testing, so that we can hardly go astray in the selection of a good cement. The three principal requisites for a first-class cement are as follows:—

1. That it sets or hardens without undue expansion or contraction.

2. That it be sufficiently finely ground.

3. That its tensile strength be high.

The usual methods of ascertaining these points are:—

1. The cake test. This test is so well known that a description of it here is necessary. When time is an object, by the use of hot water the test may be hastened. Under expert supervision the "boiling test" is by many considered superior to the cake test, but the difficulties in the way of carrying it out, and some uncertainties in the results that yet linger about this new test, prevent me from advocating its substitution for the older test.

2. The test for fineness. Ninety per cent. of the cement should pass through a hundred-mesh screen, having 10,000 holes to the inch. It would be better to use a yet finer screen for testing but for the difficulty of readily obtaining finer screens. The practice of using coarser screens is to be condemned because they pass much that is inert. The screenings should feel soft and silky to the touch. The residue on the screen should be hard, black angular grains. The economic importance of fine grinding has seldom been exaggerated. It is usually unduly disregarded, yet it has been established beyond reasonable doubt by repeated experiments that the sand-like grains of the cement are practically inert and useless. Still, unlike the first qualification, this is an economic question, and the ill effects of coarse grinding, if not apparent in the first test, can be overcome by making due allowance for the coarse portion in proportioning the cement to the aggregate, and then but little harm will follow the use of coarse ground cement in ordinary work.

3. Tensile strength. This test is usually and best made by

the aid of the ordinary testing machine. Several first-class cements will now develop tensile strengths of 600 or 700 lbs. per square inch in seven days, and while this may be too high a standard to insist upon, yet the cement that will not furnish a strength of 450 lbs. in seven days ought not, in my judgment, to be graded as first class, unless it is exceptionally fine ground.

With regard to the aggregates not so much has been published.

Sufficient interest is not usually taken in these inert materials, which nevertheless have a powerful influence upon the character of the concrete, so much so that a good aggregate with a poor cement will sometimes give better results than a good cement with a poor aggregate.

A first-class aggregate should be made of a hard, tough rock, free from clay or dirt, and having a rough surface and sharp angles when broken; it should be so graded from the finest grains to the largest pieces admissible in the work it is for, as to give, while retaining the largest proportion of large-sized pieces, the smallest proportion of voids.

If the aggregate is all of one material, the desired aggregation can be determined by weighing a given measure. That proportion which, while retaining the maximum amount of large pieces, weighs the most is the best.

If, on the other hand, the aggregate is composed of different materials, then that proportion which in a given measure and under the same limitations as just given will permit of the introduction into the filled measure of the least quantity of water is the best.

In making such tests the larger the measure the better; a round measure is better than a square box, and it should not contain less than 2 cubic feet. The material also ought to be shaken down into the measure. It is desirable, when time will permit, to make these tests with a mixture of one of cement to three of sand, but ordinarily with cements of equal fineness the relative strength of different brands will remain about the same as under the test with neat cement.

For fireproof work care should also be taken to avoid such aggregates as contain felspar, and where the possibility of the concrete being subjected to a long continued red heat is sufficiently probable as to be worthy of precautions being taken to meet its effects, limestone also should be rejected from the aggregate.

To those who have studied the matter practically it is evident that in the large majority of cases the prejudice against

the use of the dust and finer particles created in crushing brick or stone is unfounded, and the practice of prohibiting these and substituting therefor ordinary sand is strongly to be condemned. Lieutenant Innes found that both limestone dust and ground, burnt clay gave stronger results than the purest sands, and tests and works carried out under my supervision thoroughly corroborate this.

The largest stone does not necessarily make the best aggregate. For instance, finely-crushed granite is for some purposes inferior to finely crushed limestone, although as a rule the granite is the harder of the two. One reason for this is not hard to seek. Owing to the brittle quality of granite, in crushing it is not only broken into small pieces, but many of these pieces are so bruised or contused that upon a little pressure being exerted upon them, such, for instance, as can be applied by the finger or thumb, they will crumble. With limestone and many other softer rocks, by reason of their greater toughness and elasticity, this is not the case.

Again, some stones, as quartz and the like, have surfaces of such smoothness that the adhesion of the cement thereto is not so good as that between cement and other stone, such as basaltic lava, sandstones and the like, which, when fractured, present a rough surface. Such stones as these latter usually make first-class aggregate. Broken stone, as a general thing, is a better aggregate than gravel. Sometimes a mixture of the two is preferable to either alone. Usually the use of one or the other has to be determined by the economic side of the question and the local supply. When from such causes gravel is selected, its quality can be greatly improved, at small cost, by running it through a crusher that will break the larger pieces as they pass.

The common practice of limiting the maximum size pieces so that they will pass through a 3-inch ring is, I think, open to question. In massive work, stones much larger may advantageously be used, not, however, if the late fashionable practice of "dry concrete" be adhered to.

The experiments carried out by Mr. Elliott C. Clarke tend to show that the presence of a small amount of clay in the concrete is no detriment to the strength of concrete, even with clay as much as 10 per cent. of the aggregates and cement combined.

In corroboration of this I would instance the Niagara gravel, which, whilst it contains a marked quantity of clay, yet makes most excellent concrete.

Having determined the aggregate, the next important

question is what is the proper proportion of cement to use for any given work?

With first-class materials, in round figures, and within the limits of proportions between the cement and the aggregates of from 1 to 4 to 1 to 15, the crushing strength of concrete when skilfully made, at a month old, may be taken as follows in tons per square foot:—Multiply the constant number 700 by the number representing the proportion of cement used, and divide it by the relative number representing the amount of aggregate used. For instance, a concrete composed of 1 part of cement to 14 parts of aggregates should, when properly

seasoned, have a crushing strength of $\frac{700 \times 1}{14} = 50$ tons. When three months old the strength will have increased some 25 per cent., and when twelve months old it will have increased some 50 per cent.

Under this rule a concrete composed of 1 of cement to 14 of aggregate would be about on a par with good brickwork when a month old, and be about 50 per cent. stronger when twelve months old. This rule reduces the strength of the concrete too much as the proportion of aggregate is increased, but it is reasonably correct and quite safe to act upon.

SECTION C.—*Iron*—The tensile strength of concrete is comparatively little, and by reason of the gradual though slight shrinkage that takes place in all concrete structures that age in dry situations, should not be relied upon in any important work.

For giving tensile strength to concrete, all modern workers of note now use iron in some form or other.

Angular iron bars, cold-twisted, commend themselves in many ways, and on this continent they have been more largely used than any other form in concrete iron construction.

The advantages of this cold twisting are many. They may be summed up as follows:—

1. The tensile strength of iron is largely increased, viz. from 20 to 50 per cent., dependent upon quality of iron used.
2. Its elongation under strain is considerably lessened, a very important advantage in concrete iron construction.
3. It forms a continuous key with the concrete, both longitudinally and also athwart the bar. The effect of the twist is to grip the concrete in every direction, and in fireproof flooring and other work where light construction is desired, the importance of this universal key is very great, for it counteracts the tendency which the bar otherwise would have to split the concrete along the line of tension.

4. The cost of twisting is nominal, and the royalty for its use not prohibitory.

In placing these bars care should be exercised in putting them in position where they will best exert their strength. They should be straight and laid directly in line of strain. Any deviation from this rule should be such that the tendency to straighten, which invariably occurs upon the application of the strain, will do little or no damage, such a deviation, for instance, as laying the bar of a floor beam with a slight sag in the centre. In such a case when the strain takes place the tendency to straighten would have the effect of thrusting the centre of the bar upward against the downward thrust of the load, and it would be harmless. If, on the other hand, the bar was laid crowning in the centre, upon the floor being loaded, the tendency of the bar to straighten would be in the same direction as that of the downward thrust of the floor load, and the consequences would be detrimental if not fatal to the integrity of the structure.

Concrete is an excellent conservator of iron. Von Emperger states that he knows of a case where iron rods were found perfectly rust free after having been embedded in concrete below the water level for forty years.

W. G. Triest, junior, states that a wrench that had been buried in concrete twenty-two years had kept its black metallic surface.

Referring to some concrete foundations that I built about ten years ago, the president of Starr & Co. writes as follows, under date of December 30, 1893:—"Though this foundation is on tide land and submerged in salt water more than half-way up, there is no rusting or deterioration to the iron. We had occasion to cut through one of the arches and found the iron as stated." A long time ago I embedded a dozen pieces of hoop iron in as many blocks of concrete, leaving one end of each piece of iron projecting from the surface. After years of exposure to sea air, all the exposed iron had rusted away, or so nearly as to leave but a few soft, jagged needles of rust that were readily removed by the hand. In all cases upon cutting into the blocks I found the iron almost as good as new, and from 1 to 2 inches from the surface it was invariably so.

SECTION D.—*Water*.—The water for mixing should be clear and by preference soft. If it cannot be obtained of ordinary purity then due allowance should be made for the impurities by an additional quantity of cement.

Sufficient water should be used to bring the mass when thoroughly mixed into a stiff, sticky, tenacious, viscous condi-

tion. An error as to the amount of water that should be used in concrete some years ago crept into the professional practice both of engineers and architects, and with surprising rapidity permeated and revolutionised it. I allude to the erroneous theory that only sufficient water should be used to slightly moisten the mass and hardly enough to render it cohesive in its uncompacted state.

An error seldom takes the hold this did upon a skilled body of men without some apparent justification. The only justification that I have been able to find after considerable research is the fact that, in making briquettes for testing purposes, the use of a minimum quantity of water gives the best results. From this one little isolated fact the generalisation was made that, to produce the best results, concrete should be mixed in like manner. The fatal flaw in this deduction lies here, viz. that a mixture of cement or of cement and sand, with water, differs radically in conditions when to either of these gravel is added, and differs yet more when broken stone is used.

If cement, or cement and sand, is mixed with a large proportion of water, it cannot be compacted by blows or such pressure as can usually be brought to bear, for the mixture would flow from under the tamper. In the latter case, however, where gravel or broken stone are used, with a larger proportion of water, the concrete can be compacted more intimately and closely than with the minimum quantity, and under all ordinary conditions makes a much better concrete. The only exception to this is where smooth, rounded pebbles only are used with the mortar of the concrete, but this exception does not apply to ordinary gravel, and never applies where broken rock is an ingredient. I allude to this at some length, because the error, although on the wane, is still widespread.

DIVISION 3.—*Tools*.—There is great advantage and economy in mill mixing. Mills can now be obtained at a reasonable figure and should always be used on large works. By their use the cement is more fully utilised, the cost of labour lessened and the work is more uniform and satisfactory in character.

An objection is often made to mill-mixed concrete, viz. that the concrete is injured by overmixing. What is "overmixing?" A very rare distemper this. I have never once met with it, although I have been actively engaged in concrete construction for thirty-five years. It is never epidemic or fatal, but like vaccination, if present, it would prevent worse and more fatal ailments.

150 HOPE STREET, GLASGOW.

Mr. Spencer Newberry found that a mixture of 1 of cement to 3 of sand, which when worked for one minute with a trowel developed a tensile strength of 87 lbs. in seven days, developed a strength of 240 lbs. in same period after being worked with the trowel for five minutes—a remarkable result surely, and well worthy of consideration.

Contrary to the almost universal opinion, Portland cement is improved by a delay between mixing and placing. I have experimented with several brands of Portland cement and find that they were invariably improved in tensile strength by a delay of from one to four hours between mixing and placing.

In placing concrete it is preferable to have it of one uniform consistency throughout the mass. In cases, however, where it is required that the face of the work should be of a finer grade, both grades should be carried on simultaneously, the face grade being placed up against the sheeting or mould a little in advance of the backing by means of a trowel or other convenient tool. In more careful work thin strips of iron about 6 inches wide and of any lengths convenient may be set up on edge in the concrete parallel to and at any desirable distance from the face of the mould. The face concrete should then be inserted between the mould face and the iron while the backing is placed at the other side thereof. As each layer is put in the iron is drawn up a few inches, so that when the concrete is tamped the effect of the tamping is conveyed below the lower edge of the iron, and causes the two grades of concrete to become thoroughly united and monolithic.

The material should in ordinary cases be placed in thin layers, seldom greatly exceeding in depth the length of the largest aggregates used, and these layers should follow one another sufficiently quickly so that one layer does not become stiff or partially set before the next is upon it.

Flat tampers should not be used for massive work except in the first and last layers of the day's work; thin or edge tampers should be employed. Wherever practicable the concrete should be compacted by rolling in preference to tamping. It is cheaper and much more effective. I am not aware of its being done outside of my own practice, but it is certainly deserving of almost universal use. On large work steam-rollers would be excellent.

It may be accepted as an axiom that concrete cannot be too thoroughly compacted, provided the action is not violent enough to bruise or crush the aggregate.

In massive or deep work, as it proceeds through the day, ten the working surface becomes richer in mortar. When, and

as often as this occurs, the mixture should be changed by adding thereto more of the larger aggregates free from fine dust, sand or gravel, until this fault is remedied. If on the contrary at any time the surface becomes open for lack of mortar, it should be immediately remedied by putting into the mixture a lesser quantity of the larger aggregates and not substituting anything in their place.

In a similar way the amount of water used in the mixings should be regulated, changing to more or less as the working surface appears too stiff or too watery. It should be firm under the tamper or roller, and yet the mortar should be viscous and unctuous to the touch.

The quantity required to produce this condition varies greatly, dependent upon the character of the aggregates, whether but slightly or very porous, and upon the age and character of the cement and weather.

Great care should be observed in joining the work of one day to that of the next. The last layer should be thoroughly compacted and left with a slight excess of mortar. It should be finished with a level surface, which at proper time, as soon as sufficiently stiff, should be patted or stippled with a steel float so as to produce a surface studded thickly with little conical knobs. This surface should be kept wet throughout the night, and in the morning immediately before the application of the first layer of fresh concrete it should be covered with a wash consisting of a mixture of equal measures of Portland cement and air-slacked lime, mixed with water to the consistency of thick cream. This covering should be put on in excess and brushed thoroughly back and forth upon the surface so as to insure a close contact therewith, the excess being swept along just ahead of the fresh concrete until all the surface has been covered, when it should be removed.

When in place the concrete should be kept moist for as long a period of time as possible. When one bears in mind that the chemical action which causes the cement to harden can only take place in the presence of moisture, the importance of keeping the work wet is at once apparent.

In all concrete construction, excepting subway and other works where the concrete remains permanently moist, provision should be made for the slow but certain shrinkage that takes place in the concrete as it becomes thoroughly dehydrated. The vertical shrinkage will take care of itself, as the weight of the building is in harmony with its movement. The horizontal shrinkage, however, is resisted by the inertia of the structure and the friction of its foundation. There are several ways to direct

"OPTIMUS" MAGIC LANTERNS SUITED FOR DRAWING ROOM AND LECTURE HALL.

Each Magic Lantern is efficient for exhibitions. The Lens gives crisp definition, being a superior Achromatic Photographic Combination with rack and pinion. It is fitted to a telescopic enlarging tube, so gaining increased focal accommodation. The Condenser is composed of two plano-convex lens of 4 inches diameter. The refulgent lamp has 3 wicks, yielding a brilliantly illuminated picture. Each is complete in box. Pairs for dissolving arranged in one Box at same prices. Lever Disolver, 8s. 9d.

such shrinkage. That which I have found most feasible is to partially divide the wall at certain intervals, preferably over the windows where there are several in line, and to insert across the division a weathering strip of copper or lead.

Where the appearance of a straight division line on the face of the building would be objectionable, for instance, a wall blocked off into ashlar face, I build this division straight and cause it to coincide with the line of the V recesses of the ashlar, marking in every other course, and I block out in the intermediate courses recesses opposite to the division line, and subsequently fill these recesses with concrete ashlars made and seasoned beforehand. By adopting the pattern of alternate long and short ashlars in every other course with long ashlars only in the immediate course, meeting at the centre line of the short ashlars above and below them, these separate concrete ashlars may be made small, and the additional cost of their manufacture will be but trifling.

Apart from the question of appearance, some such division of the surface of a concrete wall is advisable for a twofold reason: some defining line is needed at the juncture of each day's work at least, and by dividing up the surface by deep recesses into small sections, surface cracking is largely avoided.

In reference to this shrinkage of concrete, lest I should have unnecessarily alarmed you, I will state that in a building, the walls of which were 170 feet long and divided thus, it was nearly two years before any apparent shrinkage took place, and now it can hardly be observed by a minute examination of the division joints. No outsider, even though a careful observer, would be likely to perceive any effects of this slight shrinkage when thus controlled.

In situations where it is not possible to make shrinkage joints by a liberal use of twisted iron, shrinkage cracks can often be prevented.

The Resistance of Portland Cement Concrete to the Destroying Action of Fire.

By a misunderstanding, due to a windy interference (Mr. Stone tells me one of my letters was blown out of his office window), I find I am expected to speak on the protection concrete affords iron in case of fire.

There seems to be not so much data on this subject as one would desire. What little there is, however, seems to be in favour of concrete as a fire-resistant.

It is generally understood that the artificial stone made

with Portland cement concrete withstood the Chicago fire well. Some years ago the blacksmith's shop at the Bencia Arsenal, California, was burned out, leaving the outer walls standing. This was a brick building with granite door-sills, free stone belt courses, with window caps and cornice of Portland cement concrete. I examined the ruins carefully. The granite was spoiled badly and broken into several pieces; the freestone was badly broken and injured; the brickwork was burnt out in the joints in many places, rendering the walls unsuitable, many of the bricks also being spoiled, whilst the concrete window heads, which had probably to bear the brunt of the fire on the outside, were but little injured; the surfaces had softened a little and were badly discoloured, but they remained whole and strong.

Concrete bricks made of well-burnt clinker and lime by a process which converts the lime into a silicate of lime, thereby making it resemble a Portland cement in character, withstand the action of a hot fire and the subsequent sudden cooling by water better than any burnt brick, either common pressed or fire-brick, that I could obtain in San Francisco, and I presume the same relative result would be obtained from most of the bricks of the several States.

I have repeatedly made the tests so severe that every burnt brick in the dozen or so tested at a time broke into two or more pieces, whilst under the same test the concrete bricks, beyond discolouring slightly, showed no change.

The Thermic Expansion of Portland Cement.

Bonnican Bonnicean is quoted as giving the expansion of Portland cement at 0.0000143 for 1 Celsius, and iron is given at 0.0000145, which is practically the same.

Hyatt corroborates this in some careful experiments he made with loaded floors submitted to fire, in which the concrete iron construction bore a red heat for several hours without injury.

Throughout Europe I believe hollow tile construction is almost unknown. Concrete floors are commonly used in fire-proof buildings. The result of tests undertaken in Germany under Government supervision to ascertain the relative value of the ordinary building material, including brickwork, places concrete at the head of the list as the best fire resistant.

If due regard is paid to the aggregate used, so that felspar is avoided and limestone also, where the structure is liable to prolonged hot fire, I think it will be found that Portland cement concrete is an excellent fire resistant.

PORTISHEAD LOCAL BOARD.

At a special and final sitting of the Portishead Local Board, held on December 11, the Clerk intimated that the formal sanction of the Board of Trade to the construction of the outfall of the proposed sewer on the Crown foreshore lands had been received.

The Surveyor was instructed to complete the contract drawings, specifications, &c., and advertise for tenders for carrying out the proposed sewerage works.

A vote of thanks was passed to the Chairman for his past conduct in the chair. The Chairman returned thanks, and hoped the new district council would work as happily as the Board had done.

The Chairman and members of the Board approved a testimonial acknowledging "the thorough and efficient services of the surveyor, Mr. T. J. Moss Flower, since his appointment to the office of surveyor and inspector on the formation of the Board," and bearing testimony "to the ability which Mr. Moss Flower has shown in forming and promoting the sewerage scheme for the urban district of Portishead, which has been approved by the Local Government Board, as well as to the skill and judgment shown by him in the general conduct of his duties." The testimonial was sealed and signed by all the members present.

KITCHEN BOILERS.

At the weekly meeting of the Glasgow Plumbing Class Mr. R. D. Munro delivered a lecture on kitchen boilers and their connections, with particulars of a series of bursting experiments illustrated by limelight views. Mr. John Gordon, architect, presided. The lecturer at the outset stated that he thought, in view of the greatly extended use of so-called hot-water boilers in public buildings and dwelling-houses, it was important that the students who would be the heating engineers of the next generation should have a sound training on such subjects as steam, heat and combustion. The kitchen and heating boiler was thought by many to be as innocent in the matter of heating water as the homely goblet, but the dreadful accidents which occurred in this and other cities in January last had aroused public attention to the fact that in the working of these boilers there were possibilities of great danger to life and property. The

lecturer explained at length the enormous force which could be stored up in the water contained even in the smallest boiler, and showed by diagrams how such force when suddenly relieved by rupture was certain to cause very serious damage. The water in the inlet and outlet pipes of kitchen boilers was liable to be frozen at exposed parts, and when this occurred the boiler would be hermetically sealed, and, like a tightly-corked flask containing liquid, would in these circumstances store up heat until the pressure so caused resisted the strength of its material. The boiler would then burst with great violence, and the larger the boiler and the more water it contained the greater would be the destruction. Diagrams of hot-water apparatus as fitted up in modern buildings were shown on the screen, and important advice was given with reference to the necessity for avoiding air-traps in the system and the best methods of arranging piping and connections. The lecturer thereafter went very fully into what is known as the "sudden generation of steam" theory, and showed by diagrams of the results of actual tests that it was impossible for a boiler to burst disastrously from this cause. The design and proportion of safety-valves best suited for preventing over-pressure, either through accumulation of heat in the water or by the sudden injection of water into a red-hot boiler were fully explained, and limelight views of the boilers treated in the bursting experiments were also shown. At the conclusion a vote of thanks was accorded to Mr. Munro, on the motion of Professor Jamieson, seconded by Mr. Fulton. The Chairman mentioned that the class was now in its seventh session, and the number of students enrolled (193) was the largest yet attained.

BUILDING IN THE WILLESDEN DISTRICT.

The annual report by Mr. Claude Robson, the engineer to the Willesden Local Board, contains the following respecting the new roads and buildings constructed in the year ended March 25, 1894:—The development of the district by building operations, as evidenced by plans submitted for the approval of the Board, has been greater during the year 1893-94 than in any year since the Board's formation in 1875. Plans have thus been presented for the laying out of nearly two miles of streets, for the erection of 919 houses, 53 buildings of various descriptions other than dwelling-houses and 105 additions or alterations to existing buildings.

GOLD MEDAL, Inventions Exhibition, 1885.

The applications relating to new roads principally referred to the metropolitan district; none were of a less width than 40 feet and in two cases they were laid out 50 feet wide. Sewers were provided in all instances and were laid in accordance with the rules and regulations of the Board relating to construction of sewers. The question of the desirability of increasing the width of many roads that are likely to become important thoroughfares was dealt with at some length in my last annual report, and I do not therefore propose to deal further with this matter, beyond recording the hope that the example set by the owners who have been induced to lay out roads 50 feet in width during the year 1893-94 will be generally followed in future years.

The number of houses provided for by the plans submitted for new roads was 691, which when occupied would represent a population of nearly 5,000 persons.

In all cases where the new estates abutted upon a public highway, the boundary line was set back at least 20 feet from the centre of the carriageway of the old road, in accordance with section 9 of the Willesden Local Board Act, 1887. In this way a long section of Church Road, adjoining the West Ella Estate, was widened to the extent of from 4 feet to 5 feet at a point where it was very desirable to increase its width. Harlesden Lane has been similarly widened for a short length and an improved and widened boundary arranged with the owners in Edgware Road, between the Windmill public-house and Slade Farm.

As in previous years the majority of the houses erected have been those of an estimated rental value of under 40%. These numbered 630, whilst those estimated at 40% and upwards have been 212 only. This, however, is a larger proportion than in the preceding year, when only 122 of the larger class were erected as compared to 607 of the smaller value.

The total number of buildings for which plans were submitted was 1,077, which may be divided into the following proportions, viz.:—

Dwellings over an estimated value of 40% per annum	19 $\frac{3}{4}$ per cent.
Do. under	do.	do.	do.	...	58 $\frac{1}{2}$ "
Shops	7 "
Buildings other than dwelling-houses	5 "
Alterations and additions to existing buildings	9 $\frac{1}{4}$ "

The number of applications represented by the buildings approved during the year 1893-94 has been 255. Of this

number seventeen only were definitely refused sanction owing to inability to comply with the by-laws. Eighty-nine were disapproved in the first instance, but upon a satisfactory amendment seventy-two were finally sanctioned. In twenty-two cases the localities of the proposed buildings were inspected by the outdoor committee, and report made thereon prior to consideration by the Board.

The estimated rateable value of the property represented by the plans submitted was about 26,000%, the actual increase upon the rate-books for the same period having been 18,000% only. This latter amount, however, included a few houses erected during 1892-93, but excludes many for which plans were submitted prior to March 25, 1894.

The contraventions of by-laws have numbered slightly less than in 1892-93, although a larger number of houses have been in course of erection. The specific by-laws most systematically contravened have been those relating to proper bonding of brickwork and composition of mortar, and the omission to give proper notice of completion prior to occupation of premises. It is these by-laws that have each year been most generally disregarded, and upon which I have commented in previous reports.

But little trouble has been experienced in enforcing the by-laws relating to drainage, and every care has been exercised in according careful supervision to same. The method of testing the drains hitherto adopted and as approved by the Board some years since, has been by the introduction of smoke rockets, but in some instances the water test has been applied. Objection has, however, been made by the majority of the builders to the application of this test owing to the "custom" hitherto adopted having been the smoke test. It is a point worthy of your consideration whether you should not issue instructions for the water test to be universal throughout the district. Any builder who intends carrying out a thorough and efficient system of drainage to his property would as willingly submit to the water as to the smoke test, whilst to bad work it is most desirable that as searching a test should be applied as is possible to be found.

In fourteen cases it has been found necessary to enforce compliance with the by-laws by legal action. In all cases convictions were obtained.

Owing to the large amount of building operations within the district, an additional inspector has been appointed under section 3 of the Willesden Local Board Act, 1887. There are now four inspectors in all, the Act fixing the maximum number

Pieces, Slips, Fenders, Wall Linings, Floors, Steps, Columns, Capitals, Bases, &c.

F. J. NOLF, CHISWELL HOUSE, FINSBURY PAVEMENT, LONDON, E.C.

at six. Should the amount of the fees admit of it, the desirability of still further increasing the building inspectors' staff is possibly a matter worthy of consideration.

Too much supervision to buildings cannot be accorded, and with a large district like Willesden it is but a limited amount of inspection that can be given to each building even with the reduced areas upon which the building inspectors now work. In the case of some estates, where a large number of buildings are in progress, sufficient work exists upon one estate alone to engage the attention of an inspector. This question may, however, possibly receive your consideration when the proposed reduction of fees is deliberated upon.

The income derived from building fees during the year 1893-94 has been 631*l.* 1*s.* 11*d.*, which is a fair average of the amount that may be anticipated as the annual income in the future. At no time since the first year when the maximum charge was made have the fees reached 800*l.* per annum, but during the first few years after obtaining the Act they closely approximated to that sum. This being more than was required for expenditure upon the salaries of the inspectors, they have been reduced on several occasions.

Thus a total of 55 per cent. has been taken from the charges originally inserted in the schedule attached to the Willesden Local Board Act, 1887, and which are now about 50 per cent. below those charged by the London County Council.

With the fees as at present, the estimated income may be taken at about 650*l.* per annum. This would be about sufficient to defray the expenditure required. The only justification therefore for still further reduction would be the accumulated amount derived from previous years' incomes which have exceeded the expenditure. But with the exhaustion of this fund any reduced fees would then possibly fail to supply sufficient to meet the demands, and an increase to the schedule of charges would become necessary. This, needless to say, would not be effected so easily as the various reductions recorded above.

Of the total amount of fees demanded (651*l.* 5*s.* 4*d.*), 130*l.* 13*s.* 8*d.* was outstanding at the end of the year 1893-94. This is a fairly moderate proportion, when it be remembered that the fees demanded during the last quarter of the year amounted approximately to the outstanding account at the expiration of the year. In thirty-three cases it was found necessary to issue summonses for the recovery of fees, being one less than the preceding year.

The average fee per house prior to the reduction in

January 1894 was 18*s.* 10*d.* By the reduction then made the average dropped to 15*s.* 5½*d.*, a very small amount for the work of supervision that has been accorded.

The obstruction of highways by building materials has necessitated the service of seven notices for the erection of proper hoardings for the protection of the public. In one case only was it found necessary to enforce the notice by legal action. During no year has so small a number of notices been served—a good sign that the builders are more disposed than formerly to carry out the requirements of the Board in this matter.

A large number of notices under section 75 of the Towns Improvement Clauses Act, 1875, has been served with respect to dangerous structures, more especially relating to insecure cornices and parapets in South Kilburn. This action was initiated by the lamentable accident which occurred on April 24, 1893, through the fall of parapets to the Sir Robert Peel public-house and houses adjoining, resulting in the death of two women and one child and injury to four other persons.

The evidence of dilapidation in these parapets was by no means clear so far as could be judged from an exterior inspection, as it was an extraordinary fact that the building inspector for that district had actually examined those very parapets from the roadway below one day previous to their collapse, and saw no sign whatever of their insecurity as was given in evidence before the coroner at the inquest. There is no doubt therefore to my mind that the faulty nature of the work, if at all visible, was to be found at the back of the parapet, and could only be seen by an inspection from the roof.

As many houses in the neighbourhood possessed parapets of a similar construction, it was deemed advisable that a systematic inspection should be made of all, not only from the roadway, but also from the roofs of the houses.

After a general inspection by myself, a detailed examination of certain premises was carried out by Mr. Worsley, one of the building inspectors, with great zeal and intelligence, the result being that many parapets and cornices, although apparently sound from an outside inspection, were found to be decayed and provided with no bond to the cross walls when examined from the roofs. Accordingly 236 notices were served upon owners of property to repair certain parapets, and I am glad to be able to record that although a large amount of correspondence and threatened litigation ensued, all were ultimately attended to.

The property to which the notices referred was erected in

HOWARD & SONS,

nearly every instance prior to the constitution of this Board, and the heavy composite cornices with which they were embellished were almost entirely of a uniform design enforced by the original freeholders. Thus no public supervision whatever had been accorded to the erection of the buildings, as the district was at that time under the control of the Hendon Union Authorities, who possessed no powers relating to the construction of new buildings.

In addition to the above, 242 cautionary letters were sent to owners of property possessing similar parapets to those that had fallen, but which were not in so dilapidated a condition as to warrant service of notices under the section of the Act before referred to. In most cases with regard to notices served, the heavy overhanging composite cornice was removed and replaced with a simple band or "necking," whilst additional improvement was generally effected to the houses of the neighbourhood by cleaning down and painting up the whole of the house fronts.

The cause of the accident was fully dealt with in a special report upon the subject, but it may here be briefly recorded that in my opinion the primary cause was the perishing of the mortar with which the parapets were built, and their separation from the party wall with which they should have been tied in or bonded. The ultimate and immediate cause of the collapse is of course difficult, if not impossible, to define.

Independently of the action taken by the Board with regard to dangerous cornices, fourteen notices were served in respect of ruinous buildings, all of which received attention by the necessary work being executed.

In concluding my remarks upon the section of this report relating to supervision of buildings, I would remark that the work generally has been most zealously carried out by the inspectors, whose difficult and oftentimes unpleasant task can only be appreciated by those who have had any experience thereof. Public opinion seems to infer in many instances that any faulty work that may be discovered in a building at any period after completion is due to imperfect supervision on the part of the public officials, and that each officer, notwithstanding the large area under his control, should in some unexplained manner be ubiquitous in person and enabled to supervise every section of work in every building each day carried out in an area of probably $1\frac{1}{2}$ to 2 square miles in extent.

District surveyors and building inspectors are but human, and it is an absolute impossibility for one inspector to be in thirty or forty places at one time, which would be necessary to

insure every item of work carried out being thoroughly supervised, with regard to nature of material used or method of work executed.

For absolute and perfect supervision, a clerk of the works should be placed upon each block of buildings, which would necessitate the appointment of fifty inspectors in lieu of the four now carrying out the work. As it is, I am confident they do their best, and with the cost involved for supervision of about 15s. 6d per house, I trust that both owner and occupier will acknowledge that they receive a service conscientiously performed and most moderately paid for.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

23989. William Hamilton Aitchinson, for "Improvements in and connected with flushing apparatus or appliances for water-closets, drains, and for other purposes."

24030. Samuel Coleman Srawley, for "Improvements in sash-fasteners."

24304. John Donnelly, for "Improved appliance for strengthening the sliding sashes of windows."

24339. Frederick Thomas Myerson and Thomas Lane, for "Improvements in and connected with pots, cowls, or tops applicable for chimneys and ventilating shafts."

24382. Louis Janlet, for "Improvements in flushing tanks."

24383. Louis Janlet, for "Improvements in automatic flush tanks."

24407. Franklin Alfred Wells, for "Improvements in urinals."

24428. Albert Roberts Smith, for "Improvements in stoves and fireplaces."

24436. John Eastham, for "An improved sash-fastener."
